Hiring Team, Meta

Your posting says the sales enablement content has to translate Meta Model API and Muse capabilities into something a CTO or Chief AI Officer actually weighs against alternatives. At Sensata, that was the job for a year: I ran 30+ structured interviews with OEM and distributor engineers to find out what actually moved a technical buying decision, then built the battlecards and case studies from that research for 50 reps. Win rates went up 30%. That is the loop this role is asking for, run against a harder technical audience and higher stakes.

The preferred qualifications read like a description of how I already work. I automate my own recurring market and competitive analysis at Applied Materials with AI agents built on Claude, because rebuilding the same report every cycle is time that should go into the next launch instead. I keep sharpening that as a skill, not a line I mention once, and I have been through the "build the process because none exists yet" version of this work too: at Sensata I went from Product Marketing into Pricing Lead in ten months largely because I kept building programs the team did not have, then was handed P&L ownership once they worked.

I also know the other half of this role, representing the technical buyer back to the business. At Applied Materials I turn field input from Sales, Engineering and Accounts into one market view that shapes pricing and forecasting; at Sensata I converted engineering specs into buyer-ready value propositions and tracked competitor moves across EMEA and the US so product and pricing decisions stayed grounded in what the account teams were actually hearing. An enterprise AI portfolio that ships new models on this kind of cadence needs that market view rebuilt constantly, not written once and left on a shelf.

What I would bring to this team is someone who has already run sales enablement for a genuinely technical buyer, built the program before the framework existed, and uses AI tools in the daily workflow rather than talking about them. Proof trail at adhi-product-ai.vercel.app/ref/meta.
