PITCH DECK | GOOGLE PRODUCT MARKETING MANAGER, GOOGLE LABS, GEMINI AND AI MARKETING

Labs ships emerging AI research at a speed most positioning processes cannot match. I have already run naming, launch, and post-launch adoption measurement as one motion, not three handoffs.

0-to-1 positioning for technical capability on one side, the SQL and GA4 adoption loop that tells you if it worked on the other, both run by the same person.

- **$2M+ first-year revenue** from a 0-to-1 go-to-market launch, positioning through channel
- **+18% feature adoption** found by building the post-launch SQL + GA4 measurement loop myself
- **30+ customer interviews** turned into a continuous early-adopter feedback channel
- **+15% conversion** from positioning that turned deep technical capability into buyer language
- **AI agents built on Claude** automating my own recurring market and pricing analysis today

WHY THIS DECK EXISTS

The posting does not ask for a namer and a measurer handed off in sequence. It asks for one person who treats positioning and post-launch adoption as the same feedback loop.

What that actually requires

Core positioning, naming, and value propositions written fast enough to keep pace with research that is still finding its final shape, not written after the shape is locked.

A read on post-launch adoption, sentiment, and experiment uplift that feeds back into the narrative in real time, not a quarterly report that arrives after the next launch has already shipped.

Early-adopter communities (creators, developers, power users) treated as a standing feedback channel into the roadmap, not a one-time beta list.

What I have already run

At **Sensata**, I wrote the positioning and value propositions for a new product line while the technical capability behind it was still being finalized, shipping a single 0-to-1 go-to-market motion across North America and Europe.

I built the **SQL + GA4 adoption framework myself** after launch, across 50,000+ connected devices, and used what it found to lift feature adoption 18% rather than waiting on a separate analytics team.

At **Applied Materials** today, I automate my own recurring market and pricing analysis with AI agents built on Claude, the same AI-productivity habit this posting names as a preferred qualification.

The through-line: every narrative I have written was built from the same post-launch data that then told me whether the narrative worked, run by one person, never two separate teams.

THE MANDATE, MAPPED

What the posting asks for, and where the proof already sits.

What the role covers

> *"Define core positioning, naming, and value propositions that translate complex, emerging AI research into compelling, intuitive, and mainstream narratives."*

> *"Monitor post-launch adoption, sentiment, and uplift across experiments, using real-time user insights to continuously iterate on marketing strategies."*

> *"Cultivate active early-adopter communities across creators, developers, and power users to build continuous feedback channels."*

My proof

Sensata, positioning for deep technical capability: turned a new product line's technical detail into buyer-ready value propositions, lifting conversion 15% on priority launches.

Sensata, post-launch adoption loop: built the SQL + GA4 KPI framework across 50,000+ connected devices that surfaced the high-intent cohorts driving an 18% adoption lift, iterating on strategy from the data rather than a hunch.

Sensata, early-adopter communities: ran 30+ interviews with OEMs and distributors that became a continuous feedback channel into the roadmap, raising CSAT 22%.

SwipeHire, 0-to-1 with real users: built an AI job-matching platform zero-to-one and grew an early-adopter community of 50+ users, running 8+ A/B tests that lifted activation 25%.

THE PROOF, IN DEPTH

Positioning and adoption measurement are not two different skill sets. They are the same feedback loop, read from two different ends.

Same pattern on every launch at Sensata: write the narrative, build the instrument that tells you if it landed, and let that instrument shape the next narrative.

$2M+

First-Year Revenue, 0-to-1 GTM

Positioning, messaging, channel, and launch shipped in one motion for a new sensing product line across North America and Europe.

+18%

Feature Adoption, Post-Launch

Built the SQL + GA4 measurement framework myself across 50,000+ connected devices and acted on what it found.

30+

Interviews Turned Into a Feedback Channel

OEM and distributor interviews fed straight back into the roadmap, raising CSAT 22%.

The common thread: none of this was a positioning brief handed off to a separate analytics team. Each number closed the loop from narrative to data and back to the next narrative.

FIRST 30 DAYS

What the first month on Google Labs' Gemini and AI marketing work looks like.

WEEK 1

Map the positioning-to-adoption handoff

Trace the last few Labs launches to find where naming and positioning were finalized before post-launch adoption data existed, and where that gap cost early momentum or a clear narrative.

Why first: the same first move that found the gap between pricing data and positioning work at Sensata, before rebuilding either.

WEEK 2-3

Run one feature's narrative and adoption loop end to end

Pick one Labs feature, write the core positioning and naming with Product, Engineering, and Research, then build the real-time adoption and sentiment read that feeds straight back into the narrative.

Why now: the same combined positioning-and-measurement motion that lifted feature adoption 18% at Sensata, run at the speed Labs needs.

WEEK 4

Stand up the early-adopter feedback channel

Convert the first wave of creators, developers, and power users into a standing feedback channel into the roadmap, the same continuous-interview habit that raised CSAT 22% at Sensata, and automate the first recurring data pull with an AI agent.

Why this fast: the earlier the channel exists, the sooner the next launch's narrative is built on real signal instead of a guess.

CLOSE

You are hiring someone to write the narrative and read the adoption data as one job, at the speed Labs moves. I have already run that combined motion, and put a number on each half.

The narrative half: **$2M+ first-year revenue** from a 0-to-1 go-to-market launch and **+15% conversion** from positioning that turned deep technical capability into buyer language, both at Sensata.

The adoption half: **+18% feature adoption** from a post-launch SQL + GA4 framework I built myself, and **30+ interviews** turned into a continuous early-adopter feedback channel. At Applied Materials I now automate my own recurring market and pricing analysis with agents built on Claude, so the data behind both halves stays current without a lag.
