Hiring Team, Picarro

Your posting says the Industrial Solutions PM owns outcomes, not just a backlog. That is the exact shape of the job I had at Sensata: I owned the product roadmap for sensor solutions across automotive and industrial segments, ran a 100+ feature backlog with engineering in Agile sprint cycles across 3 regions, and released 25% faster with time-to-market down 20% because of it. I would rather point to that than tell you I am excited about the mission, though I am.

The discovery-to-delivery loop your posting describes is one I already run. I ran 30+ structured customer interviews with OEMs and distributors at Sensata and turned that field input into requirements that raised CSAT 22%. I ran the same loop on my own time building SwipeHire: wrote the PRD, scoped the MVP, then ran 12+ user interviews and 8+ A/B tests before letting engineering spend grow, which is close to the sequence you need for fenceline and workplace-monitoring features before a compliance deadline forces the pace instead.

The AI-forward line in your minimum qualifications is already how I work day to day. At Applied Materials I build AI agents on Claude to automate recurring market and pricing analysis, freeing that time for the next launch instead of the last report. I also came up through a technical foundation that let me sit across the table from Sensata's OEM engineers and talk through sensor specs without a translator, the same fluency a precision-instrument PRD needs.

CRDS instruments sell against a regulatory calendar, not a release calendar: the EPA sets the HON Rule deadline, not your roadmap. That is a constraint I would want to build a backlog around, not hedge against. Proof trail at adhi-product-ai.vercel.app/ref/picarro. Happy to talk whenever works on your side.
