PITCH DECK | PICARRO PRODUCT MANAGER, INDUSTRIAL SOLUTIONS

Fenceline and workplace-monitoring features do not ship on a sprint calendar. They ship against an EPA or OSHA deadline. I already run the roadmap, backlog and discovery loop that ships features on someone else's clock, not just my own.

Built from a 100+ feature industrial-sensor backlog, 30+ customer interviews, and a product I shipped zero-to-one off my own PRD.

- **100+ Feature Backlog** - owned end to end in Agile across 3 regions at Sensata
- **30+ Customer Interviews** - OEMs and distributors, CSAT +22%
- **Zero-to-One PRD to MVP** - SwipeHire, 50+ users, activation +25%
- **$2M+ GTM Revenue** - new sensing-product launch owned end to end
- **AI Agents Built on Claude** - automating recurring analysis today

WHY THIS DECK EXISTS

Owning a feature end to end here means reading a regulatory clock, not just a sprint calendar. The backlog has to move at the EPA's and OSHA's pace, not only engineering's.

What that actually requires

A roadmap that balances near-term compliance deadlines against longer-term platform investment, re-prioritized as the regulatory picture moves.

Requirements and prototypes built from structured customer discovery, not assumption, before engineering investment scales up.

A product owner who can run Agile sprint ceremonies and still own positioning, sales enablement and competitive intel once the feature ships.

What I already run

At **Sensata**, I owned the product roadmap for sensor solutions and ran a 100+ feature backlog with engineering in Agile sprint cycles across 3 regions, cutting time-to-market 20%.

On **SwipeHire**, I wrote the PRD and scoped the MVP myself, then ran 12+ user interviews and 8+ A/B tests before letting build scope grow.

At **Applied Materials**, I build AI agents on Claude to automate the recurring analysis that would otherwise eat the time a roadmap needs.

> **The through-line: the roadmap, the discovery discipline and the AI-forward habit are not something to grow into here. They are the system I already run.**

THE MANDATE, MAPPED

What the posting asks for, and where the proof already sits.

What the role covers

> *"Set priorities and shape the Industrial Solutions roadmap, balancing near-term customer needs and compliance deadlines with longer-term platform investments."*

> *"Conduct structured customer interviews, synthesize field data, and maintain a current view of EPA rulemaking, OSHA requirements, and emerging monitoring technologies."*

> *"Serve as the product owner in Agile sprint cycles... Partner closely with R&D, engineering, data science, QA, and field teams."*

My proof

Sensata, roadmap and backlog: owned the product roadmap for sensor solutions, managing a 100+ feature backlog with engineering in Agile across 3 regions, releases 25% faster.

Sensata, structured discovery: ran 30+ customer interviews with OEMs and distributors, turning field insight into requirements that raised CSAT 22%.

Sensata, Agile product ownership: ran sprint ceremonies and backlog grooming while also owning sales enablement and competitive intel for 50+ reps.

THE PROOF, IN DEPTH

Discover the constraint, ship the requirement, then put a number on the result.

Same pattern across a 100+ feature industrial backlog and a product I built alone from a blank page: discover the real constraint, ship the requirement, then measure whether it moved.

100+ Feature Backlog

Agile Across 3 Regions

Owned the roadmap for industrial sensing products at Sensata; releases 25% faster, time-to-market cut 20%.

30+ Interviews

OEM & Distributor Discovery

Structured customer discovery turned into product requirements that raised CSAT 22%.

Zero-to-One PRD

SwipeHire, 50+ Users

Wrote the PRD, scoped the MVP, and shipped it myself before asking anyone else to build it.

Each one closed the loop from discovery to a number, not a requirements doc that sat in a folder.

FIRST 30 DAYS

What the first month on the Industrial Solutions roadmap would look like.

WEEK 1

Map the compliance clock

Build the first view of where fenceline and workplace-monitoring customers sit against EPA and OSHA deadlines, so the first prioritization call is built on the clock, not a guess.

Why first: the same first move behind the EMEA/US competitive mapping I ran at Sensata, read the landscape before committing the backlog.

WEEK 2-3

Ship the first requirement and prototype

Write the first PRD and a low-fidelity prototype directly with R&D and engineering, tested with customers before build scope locks in.

Why now: the same sequence that shipped SwipeHire's MVP on 12+ interviews and 8+ A/B tests before scaling build.

WEEK 4

Stand up the success-metrics loop

Define the post-launch metrics before the first feature ships, then automate the recurring reporting with an AI agent so the read happens every sprint, not once a quarter.

Why this fast: the same habit already running on my own market analysis at Applied Materials.

CLOSE

You are hiring someone who already owns a roadmap against someone else's clock, runs the discovery that de-risks it, and ships requirements engineering can build. I have run all three, with a number on each.

The roadmap half: **100+ feature backlog** owned end to end in Agile across 3 regions at Sensata, releases 25% faster and time-to-market cut 20%.

The discovery half: **30+ structured customer interviews** that raised CSAT 22%, plus a product built zero-to-one off my own PRD, SwipeHire, now at 50+ users. I automate my own recurring analysis with AI agents built on Claude today, because a roadmap racing a regulatory deadline cannot wait on a manual report.
