

PITCH DECK | ROBINHOOD LIFECYCLE MARKETING MANAGER

Growing an investing app past its first deposit is a retention problem, not an acquisition problem. I have already cut churn 50% and automated the lead-to-nurture flow that gets a customer there.

A record of building the segmentation, the triggered messaging and the automation a lifecycle program runs on, not just the campaign calendar sitting on top of it.

-50% cost per lead - rebuilt the WordPress-to-Pardot nurture flow end to end at Plug Power

-50% client churn - segmented, proactive retention playbooks across an 8-client portfolio at Pixis

+18% feature adoption - SQL/GA4 cohort logic across 50K+ connected devices at Sensata

AI agents on Claude - in daily production use today at Applied Materials

+35% qualified leads - lifecycle email and paid launch sequences at Sensata

A brokerage app with millions of funded accounts does not grow by mailing more people. It grows by **triggering the right message at the right point in the customer journey.**

What that actually requires

A CRM and marketing-automation layer that reacts to real behavior (a first trade, a lapsed deposit, an unused feature) instead of a static, calendar-driven send schedule.

Segmentation built on real usage signal, so retention spend goes to the account that is actually at risk instead of a blanket campaign.

Cross-functional fluency with product, data and design, since a lifecycle trigger is only as good as the event data feeding it.

What I have already built at that layer

Rebuilt the **WordPress-to-Pardot lead flow** at Plug Power end to end, sequencing nurture by engagement signal instead of a fixed schedule, cutting cost per lead 50%.

Ran **retention for an 8-client, \$15K-\$90K/month portfolio** at Pixis, replacing a shared template with segmented, proactive playbooks that cut churn 50%.

Built **SQL and GA4 cohort logic** at Sensata across 50K+ connected devices to flag high-intent behavior early enough to trigger the next message, lifting feature adoption 18%.

The through-line: retention at scale is a systems problem (data, triggers, segmentation), and I have already built that system three times over, in three different industries.

What a Lifecycle Marketing Manager role covers, and where the proof already sits.

What the role covers

- Own lifecycle and CRM marketing across the customer journey: onboarding, activation, retention and re-engagement for a consumer product.
- Build segmentation and triggered messaging so campaigns react to real behavior, not a calendar.
- Partner cross-functionally with product, data and design to keep the event data and the messaging in sync.
- Make data-driven decisions: test, measure and iterate the program against retention and engagement metrics.

My proof

- Journey-wide lifecycle ownership:** rebuilt the WordPress-to-Pardot lead flow at Plug Power end to end, from first touch to sales handoff, cutting cost per lead 50%.
- Segmentation and triggers:** built the SQL and GA4 cohort logic at Sensata across 50K+ connected devices that triggers the next message off real usage signal, lifting adoption 18%.
- Retention under P&L pressure:** cut client churn 50% at Pixis across an 8-client portfolio through segmented, proactive account playbooks.
- Data-driven cadence, AI-native:** automates repetitive campaign and pricing analysis with AI agents built on Claude, in production today at Applied Materials.

Three programs, one pattern: turn behavior data into the trigger that keeps a customer active.

Each number below came from replacing a static, one-size-fits-all send with a signal-driven one, the same shift a Robinhood lifecycle program runs on at a much larger scale.

-50% CPL

Automated Nurture Flow

Rebuilt the WordPress-to-Pardot lead flow at Plug Power, sequencing touches by engagement instead of a fixed calendar.

-50% Churn

Segmented Retention Playbooks

Replaced a shared template with account-specific retention logic across an 8-client, \$15K-\$90K/month portfolio at Pixis.

+18% Adoption

Behavioral Segmentation

SQL and GA4 cohort logic across 50K+ connected devices at Sensata, flagging intent early enough to act on it.

The same instinct scales to a brokerage app: fewer blanket sends, more triggers built on what an account actually does, measured against retention and engagement, not open rate alone.

What the first month in the Lifecycle Marketing Manager seat at Robinhood would look like.

WEEK 1 Map the current lifecycle Audit the existing journey stages, triggers and send logic end to end to find where messaging is still generic instead of signal-driven, the same audit that grounded the Pardot rebuild at Plug Power before a single email changed. ----- Why first: retention work built on assumptions instead of the actual event data is the fastest way to waste send volume.	WEEK 2-3 Ship the first triggered segment Take the single highest-friction stage in the journey (an idle account, a lapsed deposit, an unused feature) and ship one segmented, triggered campaign against it, instrumented in GA4 the way the Sensata cohort logic was. ----- Why now: one working trigger that outperforms the blanket send it replaced earns the room to build the rest of the map.	WEEK 4 Turn the win into the reporting cadence Use what the first segment proved to set the retention and engagement dashboard the team reviews weekly, the same OKR cadence built at every employer to date. ----- Why this fast: a lifecycle program only earns budget by showing the pattern before asking to scale it.
---	---	--

CLOSE

Robinhood needs a lifecycle program that treats retention as a system of triggers, not a campaign calendar. I have already built that system three times.

The core proof is Plug Power and Pixis together: an **automated, signal-driven nurture flow** that cut cost per lead 50%, and a **retention program run under real P&L pressure** across 8 accounts that cut churn 50% by replacing a shared template with segmented playbooks.

What is harder to find is someone who has done that **and** built the SQL and GA4 segmentation logic underneath it, while already running AI agents on Claude in daily production rather than treating AI automation as a slide in a strategy deck. That combination of automation, segmentation and retention discipline is what a Lifecycle Marketing Manager seat at Robinhood needs most.
