Hiring Team, Instacart

Your posting frames Ads Quality as the intersection of auction mechanics and marketplace balance, and that intersection is where I have spent real operating time. At Pixis I owned bid strategy and budget pacing for an 8-client AI adtech platform spanning Amazon Ads, Criteo and programmatic DSPs, and a full-funnel rebuild of smart bidding and creative turned one client's account into 3x ROAS in a month. Auction performance gets won as much on feed and signal quality as on raw bid amount, which is the exact tension an Ads Quality team lives inside.

The part of this role I would argue is hardest is not the auction math, it is turning an ML engineer's model output into a product requirement a non-technical stakeholder can act on fast. That is the muscle I built reading Amplitude and Tableau signals across 30+ Pixis campaigns to land a 40% ROAS lift, and it is the same muscle I use now at Applied Materials, where I run AI agents built on Claude to automate recurring analysis instead of re-deriving it every cycle.

On the product side, I owned the roadmap and a 100+-feature backlog at Sensata, running Agile with engineering across three regions to cut time-to-market 20%, then ran 30+ structured interviews that reshaped the roadmap around real adoption friction instead of guesses. On my own product, SwipeHire, I designed 8+ A/B tests that lifted activation 25%, the same fast test-and-iterate loop your posting asks the Ads Quality team to run without losing rigor.

I would like to talk about how that combination, auction-level operating experience, product ownership and working fluency with LLM-driven analysis, applies to Instacart's ads quality roadmap. Proof trail at adhi-product-ai.vercel.app/ref/instacart.
