Hiring Team, Samsung Semiconductor

Your Server SSD posting wants someone who can turn a segment's TAM into a product line strategy and then defend it with design wins, not just track the market from the sidelines. That is the work I do right now: at Applied Materials I size a fast-growing semiconductor market with Sales, Engineering and Accounts, turning field and technical input into the one forecast that drives value-based pricing and demand planning across multiple product groups.

The rest of the role is close to a job I have already run. At Sensata I benchmarked 10+ competitors to reposition a multi-$100M Industrial BU, moving revenue 12% YoY and share 8 points, then built the multimillion-dollar customer quotes that closed with senior executives in the room. Before that I owned go-to-market for a new sensing product line end to end (positioning, channel, launch) through a network of OEM and distributor accounts, turning technical specs into the story that won new designs, and built the sales enablement and training that took win rates up 30% for 50+ reps.

Samsung's Server SSD line sits in the same pattern: read the market, price it, position it, then put a deck and a training session in front of the people selling it. The forecasting discipline carries over too. At Applied Materials I build the models that project a market's inflection points so pricing and go-to-market plans keep pace with demand before a product reaches the field, the same muscle a TAM-driven product line needs.

I would like to bring that same loop (market read, pricing, positioning, sales enablement) to the NAND/SSD product line. Proof trail at adhi-product.vercel.app/ref/samsung-semiconductor-inc.
