Hiring Team, Mercury

Your Invoicing dashboard is supposed to disappear once a payment matches itself to the right invoice without anyone lifting a finger. That is the same backlog discipline I ran at Sensata, where I owned the product roadmap and a 100+-feature backlog with Engineering across 3 regions, deciding what mattered most each sprint, cutting time-to-market 20% while releases shipped 25% faster.

Talking to customers and turning what they say into the next build is where I spend the most time. I ran 30+ structured interviews with OEMs and distributors at Sensata, and the insights that came out of those conversations raised CSAT 22%. On my own product, SwipeHire, I ran 8+ A/B tests and 12+ user interviews against the activation funnel I built myself, lifting activation 25% with no team to lean on, the same high-agency ownership a sprawling invoicing backlog (integrations, templates, credit memos, promos) rewards.

Invoices are money, and I have already carried a product where a mistake is expensive. At Sensata I shaped multimillion-dollar customer quotes with senior executives and carried P&L and revenue targets directly, and the price-realignment model I built there turned competitive benchmarking into a 12% YoY revenue gain. That same close attention to detail is what a dashboard, builder and payer experience that businesses rely on to get paid needs from the person sequencing its backlog.

At Applied Materials today I build AI agents on Claude to automate the repetitive side of my own analysis work, the same without-the-hype instinct behind finding where AI actually makes getting paid faster rather than chasing a headline feature. I would like to bring that roadmap discipline to Mercury Invoicing. Proof trail at adhi-product-ai.vercel.app/ref/mercury.
