PITCH DECK | MERCURY SENIOR PRODUCT MANAGER, INVOICING

Invoicing already works. The next bet is which backlog item (accounting integrations, credit memos, promos) earns its complexity first, without losing the simplicity that won these customers.

A roadmap-and-backlog discipline built end to end before: a 100+-feature backlog run with Engineering across 3 regions, 30+ customer interviews that reshaped what shipped, and an AI product built from PRD to launch on a live API.

- **100+-feature backlog** - Sensata roadmap run with Engineering across 3 regions, releases 25% faster
- **30+ customer interviews** - Sensata discovery that raised CSAT 22%
- **$2M+ GTM owned end to end** - positioning through pricing through channel, Sensata
- **50K+ devices tracked** - KPI frameworks lifting feature adoption 18%
- **Claude AI agents** - automating repetitive analysis today at Applied Materials

WHY THIS DECK EXISTS

A product that already works has a harder roadmap problem than a greenfield one: every backlog item has to earn its complexity against the simplicity that won customers in the first place. That is a sequencing discipline, not a shipping-speed one.

What that actually requires

Deciding what ships first across a known, sprawling backlog (integrations, templates, credit memos, promos) with no blank-slate excuse.

Measuring the bet in active users, feature adoption and retention, not shipped-feature count.

Keeping Engineering, Design, Data Science, Product Marketing, Support, Sales and Risk aligned behind one sequencing call.

What I have already built at that layer

Owned a **100+-feature backlog** for Sensata's sensor roadmap with Engineering across 3 regions, cutting time-to-market 20% by deciding what mattered most each sprint.

Built **KPI frameworks in SQL and GA4** across 50K+ connected devices to track the adoption and retention signals a feature actually needs to clear.

Equipped reps with **sales enablement** and aligned Engineering, Sales and regional stakeholders behind one roadmap, lifting win rates 30%.

The through-line: sequencing a sprawling, already-live backlog against adoption and retention math, not shipping as many features as possible, is the same discipline Sensata's roadmap ran on.

THE MANDATE, MAPPED

What the role covers, and where the proof already sits.

What the role covers

> *Own the roadmap for Mercury Invoicing across every surface: the dashboard, the builder and the payer experience.*

> *Take on a full backlog of work we already know customers need: accounting integrations, invoice templates, credits and credit memos, promos and coupons.*

> *Find where AI can make getting paid meaningfully better, without chasing hype.*

My proof

Sensata roadmap: 100+-feature backlog run with Engineering across 3 regions, releases 25% faster, time-to-market cut 20%.

Sensata discovery: 30+ customer interviews with OEMs and distributors, raising CSAT 22% by turning feedback into shipped changes.

Applied Materials: AI agents built on Claude automating repetitive analysis today, the same hype-free instinct the role asks for.

A FIRST PASS AT SEQUENCING THE BACKLOG

Accounting integrations, credit memos and promos all earn their place. Which one earns it first is a product-judgment call, not a coin flip.

ACCOUNTING INTEGRATIONS

The widest segment unlock

Technology and Professional Services customers likely already live inside QuickBooks, Xero or NetSuite; closing that loop removes a manual reconciliation step for the segment with the highest switching cost once it is automated away.

Why first: the same segment-level adoption instinct that built KPI frameworks across 50K+ devices at Sensata, before feature count.

CREDITS & CREDIT MEMOS

The detail that protects trust, not the one that grows usage

Invoices are money, and a credit memo is the moment a mistake becomes a customer-trust problem. It is the retention lever in the role's own growth metric, not the active-user one.

Why next: the same close-attention discipline that carried multimillion-dollar customer quotes at Sensata without a pricing error reaching a customer.

PROMOS & COUPONS

Sequence last, not never

A promo or coupon changes how a payer interacts with the invoice itself, the riskiest surface to touch before the dashboard and builder are already earning trust on the basics.

Why last: the same simplicity discipline that kept Sensata's 100+-feature backlog shipping 25% faster, a feature that is not load-bearing does not jump the queue.

FIRST 30 DAYS

What the first month owning the Invoicing backlog would look like.

WEEK 1

Sit with customers already live on Invoicing

Talk to Technology, Professional Services and Real Estate customers before writing a backlog order, the same customer-interview discipline that shaped Sensata's 100+-feature backlog.

Why first: a sequencing call made before the customer conversation is a guess, not a plan.

WEEK 2-3

Size each backlog bet against active users, adoption and retention

Pair the interview signal with the three metrics the role is measured on, the same discipline that turned Sensata's KPI frameworks into an 18% adoption lift across 50K+ devices.

Why now: a backlog item that cannot show its adoption case gets deprioritized the first time it competes for engineering time.

WEEK 4

Ship the first bet already aligned with Engineering and Design

Bring Engineering, Design and Data Science the sequencing call and the reasoning behind it together, the same cross-regional alignment that carried a $2M+ Sensata launch end to end.

Why this fast: a PM who brings the reasoning, not just the ticket, ships fewer surprises to the team building it.

CLOSE

Invoicing needs a PM who can sequence a sprawling, already-live backlog by judgment, not just inherit one. I have already run that discipline at scale.

The core proof is Sensata: a 100+-feature roadmap owned end to end with Engineering across 3 regions, cutting time-to-market 20% and shipping releases 25% faster, built on 30+ customer interviews that raised CSAT 22%.

What is harder to find is someone who has also carried the money-is-costly side directly: multimillion-dollar customer quotes shaped alongside senior executives, and a $2M+ product launch owned end to end from positioning through pricing through channel. I bring the same discipline to the Invoicing backlog, and I keep building with AI tools today, automating repetitive analysis with **Claude agents** at Applied Materials.
