

PITCH DECK | DOORDASH MANAGER, DASHER & LOGISTICS - DASHER FINANCIAL STRATEGY & OPERATIONS

The posting asks for someone who can take a vague fintech problem, size the market, build the business case, and carry it from incubation through scaling. I am already doing exactly that, with no team to hand the ambiguous parts to.

A live fintech build, a \$627M pricing program structured from scratch, and the SQL/Excel discipline underneath both.

PriceKeel: 0-to-1 fintech-adjacent build, live pilots, first funding round

\$627M target structured from 1,200 untracked opportunities at Sensata

\$700K+ margin recovered in 2 quarters from that structure

\$2M+ first-year revenue on a concept-to-launch GTM build

AI agents built on Claude automating my own recurring analysis today

This req is not "run an existing fintech product." It is **building the first version of one, alone, before the org agrees it should exist.**

What the posting actually asks for

Identify a new product opportunity for Dashers, size the market for it, and write the business case before anyone hands you a spec.

Design experiments that validate real Dasher demand, not a survey answer, then own execution from that first signal through launch.

Do this in a high-growth environment where the problem shows up undefined and nobody is waiting to structure it for you.

What I have already built, the same way

At **PriceKeel**, I sized a market, wrote the business case and shipped the product myself: no existing team, no existing playbook, now in live customer pilots.

At **Sensata**, I turned a \$627M target and 1,200 untracked opportunities into a structured, prioritized plan that recovered \$700K+ in two quarters.

At **Applied Materials** today, I automate my own recurring analysis with AI agents built on Claude, so more hours go to the ambiguous part of the problem.

The through-line: every build on this page started as an undefined problem that nobody had structured yet, and I structured it before I was asked twice.

What the posting asks for, line by line, and where the proof already sits.

What the role covers

- "Identify new product opportunities, size the market, and build the business case."*
- "Design and run experiments to validate user demand."*
- "Own day-to-day execution and work cross-functionally to take ideas from concept to launch."*
- "You can take a vague, undefined problem and structure it yourself, without waiting."*

My proof

- PriceKeel, 0-to-1 fintech build:** sized the deal-pricing decision-integrity market for B2B SaaS, wrote the business case, shipped the guardrail engine solo, now running live pilots and the first funding round.
- Sensata Bleeders and Leakers:** built the structure for a \$627M target across 1,200 opportunities from zero, surfacing \$433M in margin gaps and recovering \$700K+ in two quarters.
- Sensata GTM, concept to launch:** owned a new sensing product line end to end, positioning through launch, across North America and Europe, to \$2M+ first-year revenue.
- SwipeHire and Plug Power, demand validation:** wrote the PRD and ran 8+ A/B tests to validate SwipeHire's pricing tiers; ran 15+ A/B tests at Plug Power to validate demand before scaling spend.

Structure the ambiguity first, then let the **numbers carry the business case instead of a hunch.**

Three different environments, same pattern: find the undefined problem, build the measurement tool before anyone asks for one, then put a number on the outcome that Finance or leadership can audit.

\$627M Target

Structured From 1,200 Untracked Opportunities

Sensata's Bleeders and Leakers Power BI dashboard, built from scratch, with no existing method to extend.

\$700K+ Recovered

In Two Quarters, From That Structure

Margin recovery negotiations run directly off the dashboard's prioritization, not off a hunch about which deals mattered.

\$2M+ Revenue

Concept-to-Launch GTM, Owned End to End

Positioning, pricing, channel and launch for a new product line across North America and Europe, first year out.

None of these started with a spec. Each one started as a number nobody had structured yet, and ended as a number Finance could audit.

What the first month sizing and building Dasher financial products at DoorDash looks like.

WEEK 1

Size the first opportunity

Pull Dasher-side pain points already surfacing in support tickets, forums and existing research, and size the market for the strongest candidate the same way PriceKeel's first guardrail engine got sized: from real behavior, not a survey.

Why first: the same first move behind PriceKeel and Bleeders and Leakers, structure the ambiguity before building anything.

WEEK 2-3

Write the business case and design the experiment

Build the case Finance and Dasher Ops can both sign off on, then design the smallest experiment that proves real Dasher demand, not a stated preference, working cross-functionally with Product and Engineering from day one.

Why now: the same build-the-case-first discipline that got PriceKeel into live pilots instead of a deck nobody acted on.

WEEK 4

Launch the experiment and instrument the read

Ship the first experiment, wire the SQL/Excel tracking that reads results without a manual rebuild each cycle, and bring the first automated version of that report using an AI agent, the same habit running at Applied Materials today.

Why this fast: a business case only holds up once the data behind it updates itself.

CLOSE

You are hiring someone to structure an undefined fintech problem and carry it from incubation through scaling. I have already run that exact motion twice, at two very different scales.

The 0-to-1 half: **PriceKeel**, a fintech-adjacent build sized, business-cased and shipped solo, now in live customer pilots and a first funding round, with no team to hand the hard part to.

The scale half: Sensata's **\$627M** Bleeders and Leakers program, structured from 1,200 untracked opportunities into a plan that recovered **\$700K+** in two quarters, plus a concept-to-launch GTM build that closed its first year at **\$2M+** in revenue. I automate the repeatable part of that work today with AI agents built on Claude, so the ambiguous part gets more of my time.
