Hiring Team, Google

The fashion brand account I ran at Pixis needed 3x ROAS in a month, not eventually, so I rebuilt the funnel top to bottom: shopping feed cleanup, smart bidding, creative refresh, lookalike expansion. That is the same lever a Google Ads PM pulls when a feature has to move an advertiser's number now, not next quarter, and I have spent years pulling it from the advertiser's seat rather than reading about it from the platform side.

I have also sat on the other side of that lever, owning the roadmap instead of just the budget. At Sensata I ran a 100+ feature backlog with engineering in Agile across three regions, cut time-to-market 20%, and ran 30+ customer interviews with OEMs and distributors that raised CSAT 22%. The muscle your posting asks for is the same one: take a fuzzy signal from users, turn it into a shipped change, then measure whether it worked.

Right now at Applied Materials I build the forecasting and market-sizing models that sit between Engineering, Sales and Accounts, and I automate the repetitive parts of that analysis with AI agents built on Claude so the judgment calls get the hours instead of the spreadsheet. Earlier, running Google Ads, SA360 and Meta campaigns at Plug Power and GenY Medium (bid strategy, feed rebuilds, -25% CPA, 16x ROAS) put me on the buying side of the exact ad products this team ships, across search, display and shopping.

I would like to bring that advertiser's-eye view to a team that ships the platform instead of just spending against it.
