PITCH DECK | APPLE PRODUCT MANAGER, OS PLATFORMS

A software platform's release calendar is a coordination problem before it is a messaging problem. I have already run that coordination, repeatedly, at comparable scale.

Release timelines, launch deliverables, and the positioning that turns a software update into a story customers act on.

- **100+** feature backlog run in Agile across 3 regions, time-to-market cut 20%
- **15%** conversion lift from positioning and launch messaging on priority releases
- **30+** customer interviews grounding every launch call, CSAT +22%
- **50+ reps** armed with sales enablement that lifted win rates 30%
- **Claude AI agents** automating recurring forecasting at Applied Materials

WHY THIS DECK EXISTS

Shipping a software update is easy. Landing release timelines, launch deliverables and one message across dozens of partners, on the same clock, is the real job.

What an OS Platforms PM runs into

Release schedules touch Engineering, PR, marketing communications, legal and sales at once; one missed handoff slips the whole platform's launch window.

A press briefing and a customer-facing changelog have to tell the same story in different voices, on the same day a beta or security release ships.

Competitive signal and usage data have to turn into a recommendation before the next release locks, not after it ships.

What I have already run, at comparable scale

At **Sensata**, ran a 100+ feature backlog in Agile with Engineering across 3 regions, cutting time-to-market 20% and accelerating releases 25%.

Owned **positioning and launch messaging** that lifted conversion 15%, and built the sales enablement (decks, case studies) that moved win rates up 30% for 50+ reps.

At **Applied Materials** now, build forecasting and value-based pricing models across multiple product groups, automating the recurring analysis with Claude AI agents.

This req asks for a PM who owns release timelines, launch deliverables and messaging across software platforms while coordinating engineering, PR and marketing comms on a fixed clock. That is the same loop above, run at Sensata's device scale.

THE REQ, MAPPED

What the OS Platforms opening asks for, and where the proof sits.

What the role covers

> *"Serve as the central hub across our software platforms, orchestrating release timelines and launch deliverables."*

> *"Partner closely with engineering and program management teams on software release timelines across platforms."*

> *"Distill insights and inform product decisions through competitive analysis, usage data, and voice of the customer insights."*

My Proof

Sensata's 100+ feature backlog: ran it in Agile with Engineering across 3 regions, cutting time-to-market 20% and accelerating releases 25%.

Launch messaging and materials: owned positioning (conversion +15%) and built the sales enablement that lifted win rates 30% for 50+ reps.

Customer and competitive signal: 30+ OEM and distributor interviews (CSAT +22%) and competitive analysis across EMEA and the US.

Cross-functional forecasting: builds forecasting and value-based pricing models across multiple product groups at Applied Materials, with Sales, Engineering and Accounts.

THE SENSATA PROOF, IN DEPTH

A 100+ feature backlog: run on a release discipline, not a wish list.

Defined and executed the product roadmap for sensor solutions, managing a 100+ feature backlog with Engineering in Agile across 3 regions.

25%

Faster Releases

The roadmap discipline that came from running the backlog against measurable release targets, not a calendar guess.

20%

Time-to-Market Cut

The compounding result of owning release timelines and launch deliverables against that same backlog.

15%

Conversion Lift

From owning the positioning and messaging that turned the roadmap into a customer-facing story.

The same discipline runs through the sales enablement that lifted win rates 30% for 50+ reps and the 30+ customer interviews that raised CSAT 22%, the channel-agnostic habit this req asks a PM to bring to Apple's software platforms.

FIRST 30 DAYS

What the first month on Apple's OS Platforms team looks like.

WEEK 1

Map the release and launch calendar

Sit with Engineering, PR and marketing comms to learn how a release currently moves from code freeze to launch deliverables, and where today's handoffs are already tight versus still manual.

Why first: the same move that made the Sensata backlog hold, map what exists before changing anything.

WEEK 2-3

Ship one launch-messaging fix

Pick the most-cited mismatch between the engineering changelog and the customer-facing story, and close it on the next minor release before the next major one locks.

Why now: closing that mismatch on a real release, not a hypothetical, is what made the 15% conversion lift at Sensata hold.

WEEK 4

Run one release end to end

Partner with one feature team to carry their release from timeline to launch messaging to post-launch read, then document it as the reference playbook.

Why this fast: a platform PM earns trust once one release has gone out clean, on time, with one story.

CLOSE

You are hiring someone to be the central hub when a software platform ships. I have already run that hub, repeatedly.

The core proof is Sensata: a **100+ feature backlog** run with Engineering in Agile across 3 regions, cutting time-to-market **20%** and lifting conversion **15%** through the positioning and launch messaging I owned.

What is harder to find is someone who also carries the cross-functional range: **sales enablement** that lifted win rates 30% for 50+ reps, **30+ customer interviews** grounding the call, and the forecasting and pricing models I build today at Applied Materials with Claude AI agents already in the workflow.
