Hiring Team, Lam Research

Dextro needs someone who can turn a wafer-fab maintenance capability into a global product roadmap that field teams and account teams can actually sell against, and that is the exact motion I run today. At Applied Materials I model semiconductor market sizing with Sales, Engineering and Accounts, turning field and technical input into one view that feeds pricing and forecasting across multiple product groups.

Before that, at Sensata, I owned the go-to-market for a brand-new line of sensing products end to end, positioning through launch, which drove $2M+ in first-year revenue. I built the product roadmap myself: a 100+ feature backlog coordinated with engineering across 3 regions, cutting time-to-market 20%. I also armed 50+ reps with the sales enablement and customer-facing collateral that let them sell a new, unfamiliar product with confidence, the same job this role needs for Dextro's partner and account teams.

I read a spec sheet the way an engineer does because I have a BE in Mechanical Engineering, then I translate it into positioning and a roadmap because of the MS in Marketing Analytics that followed. It is the combination this req names outright, and it is why I can sit in a room with product groups and corporate development and move the conversation forward instead of just taking notes.
