

PITCH DECK | VERCEL PERFORMANCE MARKETING MANAGER

Vercel sells to two different buyers on one acquisition engine: a self-serve developer and an enterprise buyer. That is a harder measurement problem than most paid acquisition roles, and it is the one I have already been solving.

Paid-acquisition ownership across Google, Meta and LinkedIn, plus the AI-native reporting habit that compresses the reporting cycle so more time goes to the creative and audience calls.

\$100K/month paid budgets owned at Plug Power across Google, Microsoft, Meta and LinkedIn

-25% CPA at Plug Power, **3x ROAS** in one month at Pixis

AI agents built on Claude automating my own recurring reporting at Applied Materials

8-client, \$15K-\$90K/month portfolio run end to end at Pixis

16x ROAS delivered for a D2C brand at GenY Medium

The role is not "run more ads." It is turning a paid-acquisition engine into a **compounding growth loop across two very different buyers.**

What that actually requires

One acquisition motion has to serve a self-serve developer who converts in minutes and an enterprise buyer whose cycle runs months, on the same channels: Google, Meta, LinkedIn, YouTube.

Multi-million-dollar spend only compounds if CAC keeps falling as budget scales, which means the reporting and testing loop has to get faster every quarter, not just the spend.

AI has to be load-bearing in that loop, not a slide: agents and automations that compress campaign turnaround and scale creative production, not just a mention in a tools list.

What I have already run

At **Plug Power**, I owned \$100K/month across Google Ads, Microsoft Ads, Meta and LinkedIn for multiple business units at once, and cut CPA 25% through bid and testing discipline.

At **Pixis**, I carried P&L for an 8-client, \$15K-\$90K-per-client-per-month portfolio and delivered 3x ROAS in a month through full-funnel restructuring, not a single lever.

At **Applied Materials** today, I automate my own recurring forecasting and reporting with AI agents built on Claude, the exact habit this posting asks for by name.

The through-line: every channel I have run, I have also had to defend on CPA or ROAS to someone with a budget line, and I have already made AI part of how that reporting gets done, not a project on the side.

What the posting asks for, and where the proof already sits.

What the role covers

"Multi-million-dollar annual paid media spend, where you beat ROAS and CAC targets and lower CAC over time."

"AI-driven operating leverage, building agents, automations, and AI-assisted workflows that compress campaign turnaround."

"Measurement and attribution... owning event-based tracking, pixels, and conversion APIs so the data stays clean."

My proof

Plug Power, \$100K/month across 4 channels: Google Ads, Microsoft Ads, Meta and LinkedIn run at once for multiple business units, with -25% CPA and a 50% cut in cost per lead through an automated WordPress-to-Pardot flow.

Applied Materials, AI agents on Claude: automated my own recurring forecasting and market-sizing reporting, the same "automated parts of your own job" signal the posting names directly.

Plug Power, closed-loop reporting: automated the Salesforce, Adobe Analytics, GA and Google Tag Manager stack for event-based, closed-loop attribution across paid channels.

Pixis, ROAS at scale: Amplitude and Tableau on user behavior across 30+ campaigns lifted blended campaign ROAS 40%, on top of a 3x-in-a-month result for one client.

Own the budget, beat the target, then automate the reporting so the next test starts sooner.

Same pattern at two different budget scales: full ownership of the channel mix, a measured result against CAC or ROAS, and an automation that removed a manual step from the next cycle.

-25% CPA

Plug Power, Paid Search + Social

Bid optimization and A/B testing across Google Ads, Microsoft Ads, Meta and LinkedIn on a \$100K/month budget spanning multiple business units.

3x ROAS

Pixis, One-Month Turnaround

Full-funnel restructuring for a fashion client: shopping feed cleanup, smart bidding, creative refresh and lookalike expansion, not one isolated lever.

-50% CPL

Plug Power, Lead-Flow Automation

Automated the WordPress-to-Pardot handoff so lead cost fell without adding spend, the same instinct AI agents extend further today.

The common thread: none of these were single-channel wins. Each one closed the loop from spend to a business metric someone else was accountable for, then automated a piece of the process so the next quarter started faster.

What the first month owning Vercel's paid acquisition engine looks like.

WEEK 1

Map spend to the two buyer motions

Pull current spend and CAC by channel and by motion (self-serve signup versus enterprise pipeline), and sit with Product Marketing, Lifecycle and Data to find where the two motions are sharing a campaign that should be split, or splitting one that should share.

Why first: the same first move behind every channel I have owned. The split shows up in the data before anyone has named it as one problem.

WEEK 2-3

Stand up the AI-assisted testing loop

Build the first agent or automation that removes a manual step from creative or audience testing, whichever is the current bottleneck, and run it against a live test so the win is measured, not theoretical.

Why now: the same move that cut cost per lead 50% at Plug Power and cuts my own reporting time today at Applied Materials.

WEEK 4

Report the first CAC trendline to leadership

Bring event-based tracking and attribution current enough to show one real trendline: CAC by channel and by motion, moving in the right direction, with the next test already queued behind it.

Why this fast: a clean number beats a plan. Every role on my resume has been measured by the metric moving, not the deck describing it.

CLOSE

You are hiring someone to turn paid acquisition into a compounding loop across two buyers, with AI doing real work in that loop. I have already run that pattern at two different budget scales.

The core proof is Plug Power and Pixis together: **-25% CPA** owning \$100K/month across Google, Microsoft, Meta and LinkedIn, and **3x ROAS in one month** carrying P&L for an 8-client paid-media portfolio, both closed with automation, not just spend.

What is harder to find is someone who has already made AI load-bearing in their own reporting, not a slide about AI. At Applied Materials I automate my own forecasting with agents built on Claude, because rebuilding the same report every cycle is time that should go to the next test instead.
