

PITCH DECK | MOVEINSYNC FOUNDER'S OFFICE PLATFORM BUILDER

Your posting asks for someone whose instinct on seeing a broken process is "I could make something that fixes this," and who has actually done it. I have, three times, without anyone handing me the spec.

A builder's proof trail: a company built from scratch, a shipped AI product, and a solo automation bot.

PriceKeel - guardrail engine and audit trail, built from a blank page

SwipeHire - AI job-matching platform shipped zero-to-one, 50+ users

NSE bot - Python scanner plus a Claude reasoning layer, built solo

\$700K+ margin recovered from a Power BI system designed from scratch

53% to 61% distributor margin lift by fixing the underlying logic

This is not a strategy seat. It is learn what is broken, agree on what good looks like, then build the thing that makes it true.

What the posting is explicit about

Not a chief-of-staff role: no board narratives, no briefing notes, no writing recommendations and handing them over. The founders are hiring for someone who ships working software, fast, with AI tooling doing the heavy lifting.

The bar is proof, not potential: "something you've built... anything real, however small," is the thing most likely to get an interview.

The right candidate has already run this loop, notice the break, agree on the target, build the fix, more than once.

What I have already built

PriceKeel: a guardrail engine and audit trail built from a blank page, with no inherited codebase to start from.

SwipeHire: an AI job-matching platform shipped zero-to-one, PRD to 50+ onboarded users, hired and managed the team that built it.

An **NSE paper-trading bot**: a Python scanner and a Claude-based reasoning layer, built solo because a manual process bothered me until I automated it.

"Your instinct on seeing a broken process is to make something that fixes it, and you've done that before" is describing exactly this pattern: PriceKeel, SwipeHire and the NSE bot are three separate proofs of the same instinct.

What the Founder's Office Platform Builder seat asks for, and where the proof sits.

What the role covers

- "You build, not just advise... a tool, an automation, a workflow, a scrappy internal system."*
- "Prove it worked. Decide what 'better' means before you build ... and show the number moved."*
- "You can disagree with someone senior and stay in the room."*

My Proof

- Sensata Bleeders and Leakers:** designed and built the Power BI system from scratch, then proved it worked with \$700K+ recovered and a 53% to 61% margin lift that held.
- PriceKeel:** raising a first round and running pilots, the same disagree-and-stay-in-the-room work of pitching a guardrail engine to skeptical finance and pricing stakeholders.
- SwipeHire and the NSE bot:** two more shipped builds, done solo or with a small team, with AI tooling used from day one, not bolted on.
- Applied Materials:** cross-functional systems work with Sales, Engineering and Accounts, the org-crossing habit this seat is built around.

Bleeders and Leakers: nobody had a way to see the problem, so I built one.

A Power BI system built from scratch, covering 1,200 pricing opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, because no such view existed before it.

\$433M

Margin Gaps Surfaced

What the system made visible for the first time: exactly where the case for action was strongest.

\$700K+

Margin Recovered in 2 Quarters

Proof the tool worked: a number that moved, decided in advance, not an activity report.

53% to 61%

Distributor Margin Lift

Held past the first cycle because the underlying logic got fixed, not just flagged.

The pattern repeats at PriceKeel (a guardrail engine and audit trail from zero) and outside work (SwipeHire, the NSE bot): notice the gap nobody has fixed, build the tool, measure whether the number actually moved.

What the first month in MoveInSync's founder's office looks like.

WEEK 1 Learn the real function Sit with the paired leader and the people doing the work to find the org-chart version and the real one: who owns what, where work gets stuck, which handoffs quietly break. Why first: the same move behind the Bleeders and Leakers system: you cannot build the right tool until you have seen the actual break, not the reported one.	WEEK 2-3 Ship a first working version Agree with the leader on what "good" looks like in a measurable number, then build a scrappy first version with AI tooling doing the heavy lifting, in front of real users fast. Why now: the same build-fast, iterate-with-real-users habit that shipped SwipeHire and the NSE bot solo.	WEEK 4 Prove the number moved Measure the tool against the number agreed in week 2, fix what does not hold, and start connecting this tool to the next function's interface. Why this fast: a tool nobody uses, or that nobody can prove moved a number, is not a finished project.
---	--	--

CLOSE

You are hiring someone who builds first and reports second. I have already run that loop three times, and I can show the numbers that moved.

The core proof is Sensata: a Power BI system **built from scratch, \$700K+ recovered** from what it surfaced, and a **53% to 61%** margin lift that held because the underlying logic got fixed.

What is harder to find is someone who is **currently founding a company** around the same build-and-prove-it-worked instinct, and who has also shipped two more builds, SwipeHire and the NSE bot, solo or near-solo, with AI tooling from day one.
