Hiring Team, TrueFoundry

Your posting describes a role that spans customers, engineering, product and business strategy, with no playbook for the ambiguous problems in between. That is the exact shape of the work I run daily at PriceKeel: building a guardrail engine from a blank page, setting up the company's own CRM, CPQ and deal-approval process, and translating early customer feedback straight into product priorities.

I have run that same bridge inside a much larger organization too. At Sensata I designed the Bleeders and Leakers Power BI system that took an ambiguous margin problem to a \$700K+ recovered number in two quarters, then shaped AP26 revenue models and site-transition strategy directly alongside senior executives. That is business-review material for leadership, built from a technical and financial mess, which is the same output your posting asks for.

What I think travels well to TrueFoundry is the habit of moving fast without losing rigor: at Applied Materials I automate recurring analysis with Claude AI agents so more time goes into the judgment calls, and I led a 5-consultant team at Simon Vision Consulting from an unstructured brief to a market-sizing model presented directly to a client's leadership.

I would like to bring that combination, comfortable with technical teams and enterprise customers, and used to taking an ambiguous priority to a measured outcome, to TrueFoundry's founder's office. Proof trail at adhithyabhaskar.vercel.app/ref/truefoundry.
