Hiring Team, Wex

Your posting asks for a PM who already uses LLM-assisted workflows to speed up requirements generation and API mapping, not one who will pick it up on the job. I already run that workflow: as Strategic Marketing III at Applied Materials I built AI agents on Claude to automate the recurring market analysis my team used to redo by hand every cycle. That is the same pattern your Applied AI and Analytics section is asking for, just pointed at semiconductor forecasting instead of claims and benefits data.

The execution side of the role is just as familiar. At Sensata I owned the product roadmap for a sensor-solutions line end to end: a 100+ feature backlog, sprint planning and refinement with engineering across 3 regions, and the judgment calls on what ships this sprint versus next quarter. That work cut time-to-market 20% and sped up releases 25%, the kind of throughput a large, multi-vertical portfolio like yours needs from a PM who can ramp across domains fast.

Reducing attrition risk is where I would focus first. At Pixis I cut client churn 50% by reading usage and support friction before it turned into a lost account, and at Sensata 30+ structured OEM interviews turned into product changes that raised CSAT 22%. Modernizing a legacy platform without breaking what large employers already depend on takes that same instinct: find the friction before the renewal conversation does.

I also build the product myself when I need to prove it works. SwipeHire, an AI job-matching platform I shipped zero to one on Python, React and the OpenAI API, taught me the API-mapping and integration tradeoffs your platform work is navigating at a much bigger scale. I would like to bring that mix of AI-assisted execution and API fluency to your Health and Benefits portfolio. Proof trail at adhi-product-ai.vercel.app/ref/wex.
