PITCH DECK | NOTION BUSINESS OPERATIONS & STRATEGY

Notion needs a Business Operations partner who turns an ambiguous strategic question into a model executives act on, not a slide that sits in a folder. I have already built that model at $627M scale, with the AI fluency your posting names by name.

A $627M quantitative model built for executives, and genuine Claude fluency, on the same resume.

- **$627M-scope model** with $433M in margin gaps surfaced for leadership
- **AI agents built on Claude** automating my own recurring analysis today
- **5-consultant team** led on Safran's market-entry business case
- **SQL + GA4 KPI frameworks** built solo, no handoff required

WHY THIS DECK EXISTS

The posting is not "write a report." It is structuring an ambiguous question into a model senior leaders act on, with no playbook handed to you.

What that actually requires

Turning ambiguous, cross-functional questions into hypotheses and a model before anyone asks for a deliverable.

Quantitative and financial modeling rigorous enough for decisions that move the business, not directional guesses.

Genuine, hands-on fluency with AI tools like Claude, used daily as a working collaborator, not a side experiment.

What I have already run

At **Sensata**, I built the FY2026 Power BI dashboard tracking 1,200 pricing opportunities against a $627M target, surfacing $433M in margin gaps for leadership to prioritize.

I led a **5-consultant team** structuring Safran's market-entry question from 170 facilities down to a SAM of 28, presenting the business case directly to their leadership.

At **Applied Materials** today, I automate my own recurring forecasting and pricing analysis with agents built on Claude.

> **The through-line: every model I have built started from an ambiguous question, not a template, and every one of them reached an executive who acted on it.**

THE MANDATE, MAPPED

What the posting asks for, and where the proof already sits.

What the role covers

> *"Structure complex, ambiguous strategic problems... defining clear hypotheses and building detailed business cases and quantitative models."*

> *"Excellent quantitative and financial modeling skills, with the attention to detail and quality bar required for decisions that affect products and the business."*

> *"Hands-on fluency with modern AI tools such as Notion AI, Claude, ChatGPT... you actively experiment with new models and workflows."*

My proof

Sensata, the business case: AP26 revenue models and a $627M-scope Power BI dashboard, surfacing $433M in margin gaps for leadership to prioritize by salesperson and product line.

Sensata, the discipline: SQL and GA4 KPI frameworks across 50,000+ connected devices, the working knowledge of SQL this role expects.

Applied Materials, the AI habit: automate recurring forecasting and pricing analysis with agents built on Claude, the exact tool this posting names.

Safran, the structuring: led a 5-consultant team from 170 facilities to a SAM of 28, presenting a market-entry business case to leadership.

THE PROOF, IN DEPTH

Structure the ambiguous question, build the model, then put it in front of the people who decide.

Same pattern every time: start from a question nobody has scoped yet, build the model that survives scrutiny, then make sure it reaches the executive who has to act on it.

$627M Target

Scope Modeled for Leadership

FY2026 Power BI dashboard tracking 1,200 pricing opportunities across 3 regions, surfacing $433M in margin gaps at Sensata.

5-Consultant Team

Led, Not Just Joined

Structured Safran's market-entry question from 170 facilities to a SAM of 28, presented directly to their leadership.

50K+ Devices

SQL + GA4, No Handoff Needed

Built the KPI frameworks that found adoption signals and lifted feature adoption 18% at Sensata.

None of these was a one-time analysis. Each closed the loop from an ambiguous question to a model to a decision leadership actually made.

FIRST 30 DAYS

What the first month structuring Notion's next strategic question looks like.

WEEK 1

Get inside the ambiguity

Sit with the Engineering, Product and Design leaders behind the open question, the same first move behind the AP26 revenue models at Sensata, before building anything.

Why first: every model I have built started from direct exposure to the real decision, not a dataset handed down.

WEEK 2-3

Build the model with the people who will use it

Turn the question into hypotheses and a quantitative model built alongside the leaders who will act on it, the same discipline behind the $627M Sensata dashboard.

Why now: a model only holds if the people deciding helped shape its assumptions, not just its formatting.

WEEK 4

Put a number in front of leadership

Present the business case and recommendation directly to decision-makers, the same motion behind the Safran market-entry presentation and the $433M margin-gap readout at Sensata.

Why this fast: structuring from scratch is the default here, not a ramp-up period.

CLOSE

You are hiring someone to structure the ambiguous question, build the model, and put it in front of the people who decide. I have already run that motion at $627M scale, with the AI fluency you named by name.

The quantitative half: a **$627M-scope Power BI dashboard** built at Sensata, surfacing $433M in margin gaps for leadership, backed by AP26 revenue models built directly with senior executives.

The structuring half: a **5-consultant team** I led on Safran's market-entry question, and AI agents built on Claude automating my own recurring analysis at Applied Materials today.
