Hiring Team, Meta

Your posting asks for a go-to-market owner across "agents, models, and solutions for developers and Enterprises," which is a wider mandate than most PMM roles admit to. At Sensata, I ran that same breadth on a smaller scale: I owned GTM for a new line of sensing products sold through both direct OEM relationships and distributor channels, which meant positioning, pricing and launch all had to hold up across two very different buyer types at once. That work ran on 30+ structured interviews with the actual engineers who had to say yes, fed straight into launch decisions, and closed with 50+ reps enabled to sell it. The result was $2M+ in first-year revenue and a 30% lift in win rate.

The preferred qualifications read like my current job description. I automate recurring market-sizing and competitive analysis at Applied Materials with AI agents built on Claude, treating prompt and context engineering as a skill I keep sharpening rather than a line I mention once. That is also where the responsible-AI piece shows up for me day to day: before a model or an agent workflow ships into a report leadership reads, I run the same kind of risk and quality check this role asks for, because a market view that is wrong moves product decisions in the wrong direction.

I know what it takes to represent the market internally to Product, Engineering and Research, because that is the other half of my current role. At Applied Materials I turn field and technical input from Sales, Engineering and Accounts into one market view that shapes pricing and forecasting; at Sensata I tracked competitor and customer moves across EMEA and the US so product decisions had a floor under them instead of a guess. A developer and Enterprise AI portfolio moving as fast as Meta's needs that market view rebuilt constantly, and influencing cross-functional teams without owning them is the exact muscle I use every week.

What I would bring to this team is someone who has already run the loop end to end: market assessment, positioning tested against a technical buyer, enablement that gets used by the teams carrying the deal, and AI built into how the work gets done rather than written about after the fact. Proof trail at adhi-product-ai.vercel.app/ref/meta.
