PITCH DECK | AUTODESK AI MARKET AND COMPETITIVE INTELLIGENCE ANALYST

A competitive-intelligence pipeline is only as current as whoever reruns it between refresh cycles. I already run that exact loop, today, without being asked twice.

Automated research cycles, cross-functional competitive benchmarking, and executive synthesis as a daily habit, not a pitch.

- **10+ competitors** benchmarked at Sensata, driving +8% market share
- **$433M** in margin gaps surfaced from a live dashboard, for leadership to act on
- **Claude AI agents** automate my recurring research pull today, at Applied Materials
- **150+ facilities, 10+ competitors** analyzed building a TAM/SAM/SOM read for Safran's own leadership
- **Python, SQL, Power BI** run behind every number above

WHY THIS DECK EXISTS

The failure mode in competitive intelligence is not the first report. It is who keeps the source list and refresh cadence alive after that report ships.

What a CI function runs into

A competitor teardown lands well once, then goes stale within a quarter because nobody owns the source monitoring and refresh cadence behind it.

Market signals, product moves, pricing shifts, share changes, arrive from different functions, Sales, Engineering, Product, and never get synthesized into one point of view before a leader needs it.

The fix is not one more report. It is one analyst who owns the pipeline, automates the refresh, and turns the signal into a point of view before the C-suite has to ask twice.

What I have already run, hands on

At **Applied Materials**, I size the semiconductor market with Sales, Engineering and Accounts, then automate the recurring part of that analysis with AI agents built on Claude, so a refresh is a review, not a rebuild.

At **Sensata**, I benchmarked 10+ competitors to realign pricing against share shifts, driving +8% market share, and ran a multi-region competitive and customer research program that read purchasing patterns straight out of the field.

At **Safran**, I led a 5-consultant team through a TAM/SAM/SOM build across 170 facilities and 10+ competitors, then presented the market-entry read to Safran's own leadership.

Build automated systems that produce competitive intelligence, track how AI is reshaping the market, and turn it into a point of view for leaders: this is the exact loop I already run.

THE REQ, MAPPED

What the AI Market and Competitive Intelligence Analyst opening asks for, and where the proof sits.

What the role covers

> *"Build and maintain automated systems that produce competitive intelligence."*

> *"You've built workflows, agents, or pipelines that run without you. Bring one to the interview."*

> *"Synthesize qualitative and quantitative information into clear points of view."*

> *"Produce recurring competitive intelligence...for leaders, including the C-suite."*

My Proof

Applied Materials automation: recurring market-sizing and forecasting analysis automated with AI agents built on Claude, so the refresh runs on its own cadence instead of a manual re-pull.

A workflow that runs without me: that same Claude-agent pipeline is the one I would bring to the interview and walk through.

Sensata and Safran synthesis: turned 10+ competitor benchmarks and 150+ facility records into one point of view for leadership, and for Safran's own executives.

Executive readouts: briefed senior executives directly on AP26 revenue models and multimillion-dollar customer quotes at Sensata.

THE COMPETITIVE-INTELLIGENCE PROOF, IN DEPTH

One benchmarking program, one market-entry study, one executive readout each time.

The common thread across both programs: read the market and the competitor set first, then turn that read into a point of view a leader actually acts on, not a report that sits in a folder.

10+

Competitors Benchmarked

At Sensata, informing a pricing realignment that drove +12% YoY revenue and +8% market share.

150+

Facilities Analyzed

At Safran, alongside 10+ competitors, building a TAM/SAM/SOM model (170 facilities to a SAM of 28) presented to Safran's own leadership.

30+

OEM and Distributor Interviews

At Sensata, pressure-testing willingness to pay and surfacing competitive gaps ahead of a new product launch.

Benchmark the field, synthesize it into one read, put it in front of the people who decide: that is the same loop I would bring to Autodesk's AI market and competitive intelligence work.

WHAT SUCCESS LOOKS LIKE, BY YOUR OWN TIMELINE

How I would ramp into source monitoring, recurring readouts, and coordinated research.

3 MONTHS

Source monitoring and refresh cadence set

Map the AI-market signals that matter across Manufacturing, AECO and Media and Entertainment, Sales, Engineering and Product partners included, and stand up the first automated refresh cadence behind them.

Why this is realistic: it is the same opening move behind the Applied Materials pipeline: align the sources first, then automate the pull.

6 MONTHS

Recurring CI readout running on automation

Get the core competitive-tracking view running on a standing refresh, deliver the first fast-turn analysis for leadership, and hand off the routine part of the pull so it runs without a manual re-check.

Why now: the same automate-then-hand-off sequence that let Claude agents take the recurring research pull off my plate at Applied Materials.

12 MONTHS

Coordinating research, trusted by the C-suite

Coordinate research and intelligence projects across functions, with a point of view the C-suite routes fast-turn questions through, not a report they have to chase.

Why this sticks: the same trust the Safran study and the Sensata benchmarking earned once leadership started acting on the findings, not just reading them.

CLOSE

You are hiring someone to build the automated system behind competitive intelligence. I have already built that exact pipeline, benchmarked the field it needs to watch, and briefed the leaders who act on it.

The core proof is the loop itself: **10+ competitors benchmarked** at Sensata driving +8% market share, **$433M in margin gaps surfaced** from a dashboard I built, and a **150+ facility, 10+ competitor** TAM/SAM/SOM study I presented to Safran's own leadership.

What is harder to find is someone who already automates the recurring part of that work with the same AI-agent habit your posting asks for. I run that today at Applied Materials, which means the workflow this role wants to see is not something I would need to build on the job, it is the one I would bring to the interview.
