Hiring Team, Autodesk

Your posting asks for someone who has already built a workflow, agent or pipeline that runs on its own, and can bring one to the interview to walk through the choices behind it. At Applied Materials I automate the recurring pull behind my semiconductor market sizing with AI agents built on Claude, so a refresh is a review, not a rebuild. At Sensata I benchmarked 10+ competitors to realign pricing against share shifts, driving +12% YoY revenue and +8% market share, and I led a 5-consultant TAM/SAM/SOM study for Safran across 170 facilities and 10+ competitors that I presented directly to Safran's own leadership.

The part of this role that is easy to underestimate is the cross-functional half: pulling technical benchmarking input from engineering and sales into one point of view before anyone has to ask for it twice. That is exactly how I size the semiconductor market today, turning field and engineering input from Sales, Engineering and Accounts into one forecast instead of three competing spreadsheets. At Sensata I ran that same synthesis across EMEA and the US, interviewing 30+ OEMs and distributors and surfacing $433M in margin gaps from a dashboard I built myself.

Fast-turn analysis for the C-suite is not new to me either. I briefed senior executives directly on AP26 revenue models and site transition strategy at Sensata, and I run the leadership decks and quarterly business reviews behind every forecast I own. Research only earns its keep once it changes a decision someone with a title is about to make, and that is the bar I hold my own work to.

I would like to bring that combination, automated research pipelines, cross-functional synthesis, and a track record of briefing leadership directly, to Autodesk's AI Market and Competitive Intelligence team. Proof trail at adhithyabhaskar.vercel.app/ref/autodesk.
