Hiring Team, Cisco

Two quarters into the Bleeders and Leakers program at Sensata, I had recovered \$700K in margin by building a Power BI dashboard that ranked 1,200 pricing opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, and told account teams exactly which quotes were bleeding margin and why. That is the shape of work I understand your Pricing Business Analyst opening is built around: turning a messy pricing or business problem into something Sales, Finance and Engineering can actually act on, then making the fix stick past the first pass.

The margin recovery was one project inside a bigger repricing effort. I also raised distributor and channel-partner margins from 53 percent to 61 percent by rebuilding how parts sold through distribution were priced, which meant sitting with Finance on the model, with Sales on what a distributor would actually accept, and with the data on where the old pricing logic had quietly drifted. None of that was a one-person spreadsheet exercise. It required the same cross-functional back-and-forth a Cisco pricing business analyst runs constantly across a much larger product portfolio, and I was doing it while carrying P&L and revenue targets for the Industrial BU, not from the sidelines.

At Applied Materials now, the same pattern holds at a different scale: I partner with Sales, Engineering and Accounts to turn field and technical input into one pricing view for a fast-moving semiconductor equipment market, forecasting inflection points instead of reacting to them after a quarter closes. I also automate the recurring parts of that analysis with AI agents built on Claude, which is less about the tool and more about not spending analyst hours on the same pivot table every cycle. A pricing team that wants creative solutions to business challenges, not just faster spreadsheets, is a team I already know how to work inside.

What I bring beyond the resume is that I am currently building PriceKeel, a decision-integrity layer for B2B SaaS deal pricing, which means I spend my other hours designing the exact kind of discount-governance logic a large pricing organization like Cisco's has to run at scale. I would like to bring both sides of that to this role: the operator who has actually closed a margin gap, and the builder who thinks about how to make the process repeatable once it is closed. Proof trail at adhi-pricing-ai.vercel.app/ref/cisco.
