

PITCH DECK | TIKTOK PRODUCT MARKETING MANAGER, AUDIENCE MEASUREMENT

Measurement products only earn advertiser trust when the GTM story and the underlying signal both hold up. I have already sold and built inside an AI ad platform where that was the whole job.

Retail-media and app-UA measurement across an 8-client portfolio, a closed-loop attribution discipline built from CRM to ad platform, and cross-functional GTM work that turned technical signal into buyer-ready proof.

8 clients, \$15K-\$90K/mo each - P&L-owning AdTech portfolio at Pixis

Retail media + app UA - Amazon Ads, Criteo, Appsflyer, Adjust measurement across channels

ROAS +40% - Amplitude/Tableau audience segments built from behavior signal

Closed-loop attribution - Salesforce-to-ad-platform reporting at Plug Power

GTM \$2M+ - Sensata sensing-product launch built on SQL/GA4 KPI frameworks

Audience measurement is not a reporting layer bolted onto GTM. It is the proof that makes the GTM story credible to a skeptical advertiser.

What that actually requires

A GTM strategy for the measurement product itself that a media buyer, a brand marketer and an internal sales team can each act on without translation.

Fluency across the channels a measurement claim has to survive: retail media, app-install attribution, and platform-native signal, not one narrow lane.

Cross-functional follow-through with data science, sales and research so a measurement finding turns into a sellable narrative, not a dashboard nobody reads.

What I have already built at that layer

Ran **retail media (Amazon Ads, Criteo) and iOS app UA (Appsflyer, Adjust)** measurement at Pixis, an AI ad platform, across an 8-client, P&L-owning portfolio.

Used **Amplitude and Tableau** to turn campaign-level behavior into audience segments, the same signal-to-narrative work a measurement GTM story depends on.

Automated the **Salesforce, Adobe Analytics and Google Tag Manager** stack at Plug Power for closed-loop reporting, so a measurement claim survived scrutiny past the first dashboard.

The through-line: I have already worked inside an AI ad platform where the product being sold was measurement itself, not a feature next to it, which is the actual hard problem inside "Audience Measurement PMM."

What the role covers, and where the proof already sits.

What the role covers

- Go-to-market strategy and measurement solutions, built for advertisers who need to trust the number before they trust the platform.*
- Cross-functional collaboration across data science, sales and research to turn a measurement capability into a story the field can sell.*
- Product marketing and AdTech fluency: knowing how a measurement claim holds up across the channels an advertiser already buys.*

My proof

- Pixis, 8-client portfolio:** ran retail media and app-UA measurement inside an AI ad platform, the same product-is-the-measurement environment this role sits in.
- Amplitude/Tableau, ROAS +40%:** turned campaign behavior into audience segments the sales team could act on, not just a report.
- Sensata, GTM \$2M+:** built the KPI frameworks in SQL and GA4 that made a technical launch a sellable customer story, the cross-functional GTM discipline this role names directly.

Pixis: measurement **as the product**, not a report about the product.

Built as the audience-and-attribution layer behind an 8-client AI ad platform portfolio, spanning retail media and app-install measurement at once.

8 / \$15K-\$90K

Clients / Monthly Media Managed Each

P&L-owning portfolio on an AI ad platform, hired and managed as an 8-person team.

ROAS +40%

From Amplitude/Tableau Segments

Behavior signal across 30+ campaigns turned into audiences the sales team could act on.

3x ROAS

Fashion Brand, One Month

Full-funnel restructure: feed cleanup, smart bidding, creative refresh, lookalike expansion.

The same closed-loop instinct carries over from Plug Power, where I automated the Salesforce, Adobe Analytics and Google Tag Manager stack so paid spend tied back to lead quality instead of platform-reported clicks, the attribution discipline a measurement product has to survive.

What the first month on TikTok's Audience Measurement GTM would look like.

WEEK 1

Sit with data science before the deck

Pull the current measurement methodology and its known edge cases first, the same audience-first move that shaped the KPI frameworks at Sensata.

Why first: a GTM story built ahead of the methodology's real limits gets picked apart by the first skeptical advertiser.

WEEK 2-3

Map the claim across channels advertisers already buy

Stress-test the measurement story against retail-media and app-install use cases, the cross-channel check that Pixis's client portfolio ran on every account.

Why now: a measurement story that only holds for one channel is not a GTM strategy, it is a case study.

WEEK 4

Ship the sales-enablement version

Turn the stress-tested story into the decks and objection-handling material the field needs, the same enablement handoff that lifted win rates 30% at Sensata.

Why this fast: a measurement product earns adoption when sales can sell it without a data scientist on the call.

CLOSE

TikTok's Audience Measurement GTM needs someone who has already sold measurement as the product, not marketed a feature next to it. I have.

The core proof is Pixis: [retail media and app-UA measurement](#) run inside an AI ad platform's 8-client, P&L-owning portfolio, with the [Amplitude and Tableau](#) discipline that turns behavior signal into a story sales can act on.

What is harder to find is someone who has also carried that discipline into a Salesforce-to-ad-platform closed loop at Plug Power and a cross-functional GTM launch at Sensata, then kept building that muscle today by automating repetitive analysis with [Claude AI agents](#) at Applied Materials.
