Hiring Team, Quest Software

Two quarters into the Bleeders and Leakers program at Sensata, I had recovered \$700K in margin by building a Power BI dashboard that ranked 1,200 pricing opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, then told account teams exactly which quotes were bleeding margin and why. That is the loop your Strategic Pricing Lead posting is built around: pricing strategy development, competitive analysis and financial modeling that Sales, Finance and the rest of the business can act on, not just read.

That margin recovery only held because the work behind it was cross-functional. I raised distributor and channel-partner margins from 53 percent to 61 percent by rebuilding how parts sold through distribution were priced, which meant building the model with Finance, testing what a distributor would actually accept with Sales, and finding where the old pricing logic had quietly drifted. I ran that program while carrying P&L and revenue targets for a multi-\$100M industrial business, and drove +12% YoY revenue and +8% market share off competitive analysis against 10 or more players.

At Applied Materials now, I run the same pricing loop at a different scale: partnering with Sales, Engineering and Accounts to turn field and technical input into one pricing strategy for a fast-moving, highly technical equipment market, forecasting inflection points instead of reacting after a quarter closes. Complex, regulated, technical B2B portfolios are the pattern I actually know how to price, whether the product is a semiconductor tool or spans cybersecurity and platform management, and I automate the recurring financial modeling with AI agents built on Claude so more of the week goes to the pricing call itself.

What I bring beyond the resume is that I am building PriceKeel, a decision-integrity layer for B2B SaaS deal pricing, which means the other half of my week goes into designing the exact discount-governance logic a pricing organization running two portfolios at once eventually wants internally. I would like to bring both to this role: the operator who has already closed a margin gap, and the builder who thinks about how to make the fix repeatable.
