Hiring Team, Lumin Digital

Financial institutions buy complex software the way OEMs and distributors bought Sensata's new sensing line: through a buying committee that needs the technical detail translated into a business case before anyone signs. I wrote that translation for Sensata's launch, positioning and messaging that turned deep sensor specs into a value story a technical buyer would act on, and it lifted conversion 15% on priority launches.

Your posting asks for buyer research and competitive intelligence that actually shapes positioning, not a research deck nobody reads. I ran 30+ interviews with OEM and distributor engineers to find the language that closed deals, then built competitive benchmarking against 10+ players that fed a pricing realignment worth +12% YoY revenue and +8% market share. That instinct, go find out how the buyer actually evaluates and adopts, is what I'd bring to mapping how financial institutions evaluate, buy and implement your platform.

The enablement side of the role is where I've spent the most time. I built the decks and case studies that 50+ Sensata reps carried into technical sales conversations, and that content lifted win rates 30%. I also automate the repetitive half of this work: at Applied Materials I run AI agents built on Claude to keep competitive and pricing analysis current instead of rebuilding it by hand every cycle, the same habit I'd apply to keeping content performance and win data current instead of stale.

I'd like to bring that positioning-to-enablement pipeline to Lumin's GTM work streams. Proof trail at [adhi-product-ai.vercel.app/ref/lumin-digital](https://adhi-product-ai.vercel.app/ref/lumin-digital). Happy to talk whenever works on your side.
