Hiring Team, Coram AI

At PriceKeel I run the company's own CRM, CPQ, forecast and pipeline reviews, and deal approvals end to end, with an audit trail Finance can book against instead of a spreadsheet nobody trusts. That is the same ownership your posting describes for this role: take a GTM process from an ambiguous starting point through design, implementation, adoption and a result someone else can measure.

Your posting asks for hands-on CRM administration: object and property design, pipelines, workflows, permissions, data quality, and turning rep and system data into process fixes. At Sensata I built the Bleeders and Leakers Power BI dashboard, tracking 1,200 pricing opportunities against a $627M target with win rate, dollar-per-win and stage distribution broken out by salesperson, then used the $433M in margin gaps it surfaced to recover $700K+ in margin in 2 quarters. That is the same structured-data-to-process-fix loop this role runs on a sales stack instead of a pricing one. I wired a comparable integration at Plug Power, tying Salesforce, Adobe Analytics and Google Tag Manager together for closed-loop reporting, so keeping CRM, pipeline and attribution data in sync across systems is familiar ground, not a new idea.

Building and deploying AI agents is already how I work day to day, not a pitch I am making for the first time. At Applied Materials I run Claude-built agents to automate repetitive revenue analysis, and I shipped that same instinct end to end at SwipeHire: wrote the PRD, built the MVP, and shipped an automated matching and resume-tailoring workflow that onboarded 50+ early users. I have made the build-versus-buy call both ways: PriceKeel is a system I built because nothing off the shelf fit the problem, and Applied Materials is where I pick up an existing tool and wire an agent around it instead.

GTM systems work only sticks when reps actually adopt it, and the fastest path I have found to adoption is to ship the smallest version of a fix, show the rep the time it buys back, and only then build the permissions and workflow layer around it. I would welcome a conversation about where that approach fits into your HubSpot, Salesloft and Nooks stack. A fuller trail of this work, including the PriceKeel build and the Sensata dashboard, lives at adhithyabhaskar.vercel.app/ref/coram-ai.
