Hiring Team, Snowflake

I did not start Sensata's sensor roadmap by asking engineering for a release date. I ran 30+ interviews with OEMs and distributors first, found where the real friction sat, then built the 100+ feature backlog around it, cutting time-to-market 20% and accelerating releases 25% because engineering was executing a plan built on their own constraints instead of around them. That is the MVP-first habit your posting describes: validate the hypothesis with real customers before anyone scales it.

The rest of that roadmap work maps onto what you are calling Balance Technical Constraints. Every quarter at Applied Materials I take deep technical input straight from Engineering and turn it into one forecasting model that multiple product groups can act on without a second translation layer, the same weighing of engineering effort against customer value your migrations features need. And I do not let a feature go quiet after launch: I defined the KPI framework in SQL and GA4 that tracked 50K+ connected devices at Sensata, the kind of usage and health-metrics discipline that would let me own your north star number, migration time, instead of just reporting on it after the fact.

On the GenAI side, I would rather show the instinct than claim the vocabulary. I run AI agents built on Claude at Applied Materials that act on forecasting and market analysis instead of just summarizing it, and I built a reasoning layer on the Claude API on top of a Python data pipeline for a personal trading project, the same pattern of putting a generative model to work on top of existing data logic that your migrations engine is doing at enterprise scale. I also know what it costs to keep cross-functional stakeholders aligned without surprises: I carry P&L targets and run the OKR cadence that Sales, Engineering and Accounts brief from today.

I would welcome 30 minutes to walk through how the Sensata backlog work maps onto owning a migrations feature end to end, from customer discovery through the metric that proves it shipped. Proof trail at adhi-product-ai.vercel.app/ref/snowflake.
