

PITCH DECK | AWS SALES OPERATIONS LEAD, STRATEGIC ACCOUNTS

Strategic Accounts is AWS's most complex, highest-visibility account base. I have already built the forecast-accuracy and pipeline-hygiene system that keeps a \$600M-scale target from drifting between what Finance sees and what the account team believes.

Revenue analysis, pipeline hygiene and AI-tooling adoption built by someone who runs that exact operating model today.

\$433M in margin gaps surfaced by one shared stage-definition and forecast standard

1,200 opportunities scored against a \$627M target across 3 regions, 20 product lines

\$700K+ recovered in 2 quarters once the variance drivers were named

PriceKeel - founder running CRM, CPQ, forecast reviews and deal approvals end to end

Claude AI agents automate recurring forecasting work, impact measured not assumed

The risk is not a slow forecast. It is **Finance, ProServe and the account team each holding a slightly different number for the same quarter.**

What a complex, high-touch segment runs into

Strategic Accounts is a portfolio of AWS's largest, most scrutinized relationships, which means the cost of a stale stage definition or an un-reconciled variance shows up fastest in a WBR or MBR, in front of the people who act on the number.

As territory, quota and account plans shift under a segment this size, pipeline hygiene and forecast accuracy drift apart unless one shared standard is forcing Finance, ProServe and the account team to read the same definitions.

The fix is not another reconciliation meeting. It is a documented metrics mechanism, plus the change-management habit that keeps the standard from decaying as the account base grows.

What I have already run, at comparable scale

At **Sensata**, I built the Bleeders and Leakers Power BI dashboard: 1,200 opportunities scored against a \$627M target across 3 regions and 20 product lines, with one win-rate and stage-distribution definition every stakeholder used.

I did not stop at the dashboard. I **resolved the variance** behind the worst gaps directly with the account owners, which is why the \$433M in surfaced margin turned into \$700K+ actually recovered in 2 quarters.

I run that same loop today at **PriceKeel**: CRM and CPQ, forecast and pipeline reviews, and deal approvals, with a documented audit trail, because a metrics mechanism only works if someone owns it after launch.

Revenue analysis and forecast accuracy, pipeline quality and hygiene, and goals-and-metrics mechanisms for accountability are describing this exact loop: name the variance once, document the standard, and keep Finance, ProServe and the account team reading the same number.

What the Sales Operations Lead opening asks for, and where the proof sits.

What the role covers

- "Own revenue analysis and forecast accuracy, surfacing the why behind weekly and monthly trends in partnership with Finance and ProServe."*
- "Drive measurable improvement in pipeline quality and hygiene, and design goals and metrics mechanisms that drive accountability."*
- "Lead adoption of AI tooling for operational use cases, quantifying the impact."*

My Proof

- Bleeders and Leakers dashboard at Sensata:** built the stage-definition and win-rate standard, ranked 1,200 opportunities by salesperson and product line, and closed \$700K+ of the \$433M in gaps it surfaced in 2 quarters.
- CRM, CPQ and forecast reviews at PriceKeel:** set up and run the company's own CRM and CPQ, forecast and pipeline reviews, and deal approvals end to end, with a documented audit trail behind every decision.
- Applied Materials today:** build forecasting models across multiple product groups, turning Sales and Engineering input into one demand view checked against P&L targets.
- AI tooling, impact measured:** automate recurring forecasting and reporting work with Claude AI agents, and quantify the hours it frees, the exact adoption-with-measurement ask in this posting.

Bleeders and Leakers: one shared standard, one owner per variance, a number that held through the next review.

Built as a BU-wide Power BI system covering 1,200 pricing opportunities against a \$627M target across 3 regions, 4 product families and 20 product lines, with pipeline funnel, win rate, average \$/win and stage distribution by salesperson: the same forecast-accuracy and pipeline-hygiene view a Strategic Accounts WBR/MBR has to deliver every week.

\$433M

Margin Gaps Surfaced

The metrics mechanism's job: rank every opportunity on one consistent definition so leadership could prioritize by owner instead of chasing anecdotes.

\$700K+

Margin Recovered in 2 Quarters

Closed through variance analysis that named the driver behind each gap, built on competitive data and documented customer willingness to pay.

53% to 61%

Distributor Margin Lift

Fixed the deal structure itself and routed it through Finance and Sales sign-off, so the gain held past the first repricing pass.

The same BU carried P&L and revenue targets and ran multimillion-dollar customer quotes alongside senior executives, where Finance, Sales and leadership all had to agree on the same number before a deal moved. The common thread: one shared standard, then a fix measured after it shipped, not assumed.

What the first month on AWS Strategic Accounts' Business Operations team looks like.

WEEK 1

Map where the numbers disagree

Pull stage definitions, forecast inputs and account plans as they exist today across Finance, ProServe and the account teams, and trace where two groups use the same term to mean different things in a WBR or MBR.

Why first: the disagreement is visible in the data before anyone names it. Same move that started the Bleeders and Leakers program.

WEEK 2-3

Ship the metrics mechanism

Document one forecast-accuracy and pipeline-hygiene standard, build the self-service dashboard behind it, and pressure-test it with Finance, ProServe and account leadership against real territory and quota plans before it goes into the weekly cadence.

Why now: naming the variance against one real target, then verifying with every stakeholder, is what made the \$433M figure turn into \$700K+ recovered.

WEEK 4

Standardize and train on it

Turn the Week 1 findings into a change-management and training standard for the account teams, define the tooling requirements the standard exposes, and set the first AI-tooling use case with its impact measured, not assumed.

Why this fast: a metrics mechanism matters less if the training and tooling behind it stay ad hoc. Repeatability is the actual ask behind accountability.

CLOSE

You are hiring someone to keep forecast accuracy and pipeline hygiene predictable as Strategic Accounts scales. I have already built the standard that does exactly that.

The core proof is Sensata: **\$700K+ in margin recovered in 2 quarters**, out of **\$433M** in gaps surfaced by a dashboard that gave Finance, Sales and leadership one shared stage-definition and win-rate view of 1,200 opportunities against a \$627M target.

What is harder to find is someone who also runs that same stack today. I set up and operate **CRM, CPQ, forecast and pipeline reviews as founder of PriceKeel**, and I automate and measure my own forecasting work with Claude AI agents at Applied Materials, which means the operating-cadence and AI-adoption instinct behind this role is not something I would need to develop on the job.
