Hiring Team, Amazon Web Services (AWS)

At Sensata I built the FY2026 Bleeders and Leakers Power BI dashboard: 1,200 pricing opportunities scored against a \$627M target across 3 regions and 20 product lines, with win rate, average dollar per win and stage distribution tracked by salesperson. That dashboard is what surfaced \$433M in margin gaps for leadership to prioritize, and it is the same muscle your posting asks for when it wants someone to explain the why behind weekly and monthly trends in partnership with Finance and ProServe, not just report the number.

Pipeline hygiene and a repeatable operating cadence are not new to me either. The Bleeders and Leakers program ran on one shared stage-definition and win-rate standard across every region and product line, the same consistency your Weekly and Monthly Business Reviews need to hold up as territory, quota and account plans change under them. Today at PriceKeel, the company I founded, I run the CRM and CPQ, the forecast and pipeline reviews, and the deal approvals myself, with an audit trail Finance can check against the deal data directly, not a spreadsheet reconstructed after the fact.

Your posting is specific about quantifying AI tooling adoption, not just trying it. At Applied Materials I automate the repetitive share of my own forecasting and market-sizing analysis with AI agents built on Claude, and I measure what that frees up for the judgment calls a forecast review actually needs. I have also run the harder half once already: training 50-plus Sensata reps onto a new sales-enablement standard until it lifted win rates 30%, not just documenting the standard and moving on.

Strategic Accounts carries AWS's most complex, highest-visibility relationships, which is exactly the kind of account base where a forecast number has to be right the first time someone reads it in a business review. I would like to bring that discipline to your Business Operations team. Proof trail at adhithyabhaskar.vercel.app/ref/aws.
