

PITCH DECK | SUPERMICRO PRODUCT MANAGER, KEY COMPONENTS

**Key Components needs requirements built from customer input, market and competitive forces, carried across the full lifecycle, with vendors negotiated and sales trained on the result. I have already run that pattern on hardware, twice.**

*Requirements definition, lifecycle management, vendor negotiation, data modeling and sales enablement, the five pieces the posting names, each with a hardware proof point attached.*

**100+ feature backlog** owned for new sensing hardware at Sensata, releases 25% faster

**53% to 61% margin** on distributor and channel-partner repricing through vendor negotiation

**\$627M Power BI model** across 3 regions, 4 product families, 20 product lines

**50+ sales reps trained** as product SME, win rates up 30%

**Semiconductor equipment market sizing** with Sales and Engineering at Applied Materials

## The mandate is not "write a spec sheet." It is requirements from the field, a vendor negotiation, and a lifecycle plan someone else can sell.

### What that actually requires

Requirements have to come from three places at once, customer input, market and competitive forces, and company capabilities, reconciled into one spec before Engineering ever opens a ticket.

The lifecycle does not stop at launch. A component manager owns it through growth, maturity and decline, which means pricing, positioning and vendor terms all have to move together over years, not a single release.

None of it lands if the sales team cannot explain it. The PM has to be the subject matter expert standing in front of reps, internal and external, making the requirements sellable.

### What I have already run

At **Sensata**, I converted 30+ OEM and distributor interviews into a 100+ feature backlog for new sensing hardware, then worked it with Engineering in Agile across 3 regions.

At **Sensata** again, I repriced parts sold through distribution, raising distributor and channel-partner margins from 53% to 61% by negotiating directly on competitive gaps.

At **Applied Materials** today, I size the semiconductor equipment market with Sales and Engineering, the same cross-functional requirements loop Key Components runs on.

The through-line: every requirement I have shipped was reconciled from the field, priced against a competitor, and handed to a sales team that could actually sell it, not just a backlog ticket.

# What the posting asks for, and where the proof already sits.

## What the role covers

- "Develop new product requirements based on customer input, market and competitive forces and company capabilities."*
- "Collaborate with external vendors on requirements definition and feature development."*
- "Provide support in the development of new data models and data visualization in strong analytical and strategic thinking."*
- "Provide product subject matter expertise and leadership to sales functional team training."*

## My proof

- Sensata, requirements from the field:** 30+ OEM and distributor interviews converted into a 100+ feature backlog, worked through Engineering in Agile across 3 regions.
- Sensata, vendor negotiation:** repriced parts sold through distribution, raising distributor and channel-partner margins 53% to 61% on competitive gaps.
- Sensata, data modeling:** built the FY2026 Power BI dashboard against a \$627M target across 3 regions, 4 product families and 20 product lines.
- Sensata, sales SME:** trained 50+ reps on new sensing hardware with case studies and decks, lifting win rates 30%.

Field input becomes a backlog, the backlog becomes a vendor negotiation, and **the result becomes something sales can sell.**

Same loop, three stages, each with a measured result: requirements definition, vendor and channel economics, and the sales enablement that turns a spec into a win.

None of these stages ran in isolation. The backlog fed the vendor negotiation, and the vendor negotiation fed the sales enablement material, one requirements pipeline, not three separate projects.

# What the first month owning Supermicro's Key Components requirements looks like.

**WEEK 1**

**Pull the current requirements sources together**

Sit with Sales, Engineering and the key external vendors to map where customer input, market research and competitive teardowns already live, and where the gaps are between what customers ask for and what the current roadmap covers.

-----

**Why first:** the same first move that built the 100+ feature backlog at Sensata, find the gap between field input and the current spec before proposing anything new.

**WEEK 2-3**

**Draft the first requirements document with vendor input**

Build the first market-requirements spec in partnership with an external vendor on a live feature, documenting the competitive and company-capability tradeoffs so the lifecycle plan is defensible past launch.

-----

**Why now:** the same discipline that turned Sensata distributor conversations into a 53% to 61% margin move.

**WEEK 4**

**Train sales on the first component story**

Package the requirements work into a sales-facing case study and deck, and run the first internal and external sales SME session so the component has a seller behind it, not just a spec.

-----

**Why this fast:** at Sensata this exact sequence lifted win rates 30% within the first training cycle.

CLOSE

## You are hiring someone to turn customer input, market forces and vendor terms into a component the sales team can sell. I have already run that loop on hardware.

The core proof is one Sensata loop run twice: a **100+ feature backlog** built from 30+ OEM and distributor interviews, and a **53% to 61% distributor margin move** negotiated on the same competitive data, both closed with sales trained to sell the result at a **30% win-rate lift**.

What carries into Key Components is the data modeling habit behind all of it. The FY2026 Power BI dashboard tracked \$627M in distributor opportunity across 3 regions and 20 product lines, and at Applied Materials today I automate the recurring version of that same reporting with AI agents built on Claude, so the hours go into the next requirements cycle, not rebuilding the last one.
