Hiring Team, Gap Inc.

Your posting describes the Senior Analyst as the person who validates outputs from pricing agents before they inform a decision, not just someone who runs a model. I built that habit before it was asked of me. At Sensata I ran the Bleeders and Leakers program: pricing models and scenario analyses applied against competitive gaps and customer willingness to pay, which recovered $700K plus in margin in two quarters and raised distributor margins from 53% to 61% in the same stretch. That discipline, run the model, check the output, flag what looks wrong before it moves forward, is the exact workflow your team is asking an analyst to own.

I also know what it takes to monitor pricing performance in season rather than after the fact. The FY2026 Bleeders and Leakers Power BI dashboard I built tracked 1,200 pricing opportunities against a $627 million target across three regions, surfacing $433 million in margin gaps so leadership could prioritize by salesperson and product line instead of guessing. I built a second model flagging line items where a price change could lift profitability more than 50 percent. Both were scenario and sensitivity tools built to be checked against reality every week, not run once and filed away.

The AI-partnership mindset in your posting is not new territory for me either. As Strategic Marketing III at Applied Materials I automate repetitive pricing and forecasting analysis with agents built on Claude, and I review every output with the same skepticism I would apply to a junior analyst's first draft: does the input make sense, does the output hold up, what needs a human before it ships. I built the same oversight habit from the other side at PriceKeel, the company I founded, where the guardrail engine I designed flags a discount exception and I document exactly where its recommendation falls short so the logic keeps improving. Training a model, not just trusting it, is work I already do daily.

What I would bring to this analyst seat is comfort being the foundational layer of a function being built from scratch: clean data prep, well-organized materials your manager can walk into a business review with, and a habit of asking why the numbers matter rather than just producing them.
