Hiring Team, FRND

At Sensata, I was handed a vague "margin is leaking somewhere" problem and turned it into a dashboard covering 1,200 pricing opportunities against a $627M target, surfaced $433M in gaps for leadership to prioritize, then negotiated $700K+ of it back in two quarters. That is the muscle your posting is asking for: find the leak in a funnel or a cohort, turn it into a number, and own the outcome instead of handing off a slide deck. I would want to bring that same instinct to FRND's retention initiatives and new revenue lines.

I am building PriceKeel right now, zero to one, with no team to delegate to: I scoped the product, built the guardrail engine and audit trail myself, set up the CRM and deal-approval workflow from scratch, and I am running pilots while raising the first round. That is the same posture your "what you will own" section describes, taking an initiative from ideation through scope, resourcing and measured outcome, not just the strategy slide. At Applied Materials I run the business operating rhythm for a fast-growing segment: I set targets, drive the weekly and quarterly reviews, and I am the person turning scattered input from Sales, Engineering and Accounts into one plan everyone moves on.

FRND's note about making the way you work AI-native is not an afterthought for me. I already automate repetitive research and analysis with AI agents built on Claude at Applied Materials, and I look for the next piece of the workflow to hand to an agent rather than a person. Scaling a platform across India, LATAM and MENA will produce more data and more funnels than any one person can watch manually, and I would rather build the system that watches them than try to watch them myself.

I write clearly, I take positions, and I am comfortable shipping a decision before every input is in, because that is how PriceKeel gets built this month. Proof trail at adhithyabhaskar.vercel.app/ref/frnd.
