Hiring Team, Jerry

Your posting says the team doesn't just run analyses and build dashboards, it shapes what questions to ask before anyone touches the data. That is exactly how I built Sensata's Bleeders and Leakers program: before building a single chart, I had to decide which of 1,200 pricing opportunities against a $627M target were worth analyzing at all. The dashboard that came out of that decision surfaced $433M in margin gaps and helped recover $700K+ in two quarters, because the structure came before the SQL.

I like that this role is embedded inside one business unit rather than sitting central and detached. At Sensata I owned the analytical function for a new sensing-product launch end to end: built the KPI framework in SQL and GA4 across 50K+ connected devices, ran 30+ customer interviews to pressure-test the hypotheses before building anything, then took the findings straight to the product roadmap. At Applied Materials now, I size a fast-growing semiconductor market in partnership with Sales, Engineering and Accounts, and carry P&L targets on the pricing calls that come out of it. Both jobs are the same shape as what you're describing: own a business question, do the analysis yourself, bring the recommendation to the people who have to act on it.

The part of your posting I take most literally is "act like your name is on the door." I built the Bleeders and Leakers dashboard because the margin gaps it exposed weren't anyone else's problem to find, and I built a BU-wide price-increase model afterward because the dashboard alone did not move the number far enough. I'd rather be the person who flags the broken thing than the person who waits for someone else to.
