PITCH DECK | APPLE PRODUCT MANAGER, EXPERIMENTATION PLATFORM

A platform that governs online controlled experiments only earns trust once a PM can define the metric, run the test, and let the result win the argument. I have already run that discipline, repeatedly.

Structured A/B testing, SQL-grounded KPI definition, and the cross-functional pull to ship a roadmap engineering and data science trust.

- **100+** feature backlog run in Agile across 3 regions, time-to-market cut 20%
- **15+ / 8+ / 30+** A/B tests and campaign experiments run across three roles
- **18%** feature adoption lift from a KPI framework built in SQL and GA4
- **40% ROAS lift** from Amplitude/Tableau experiment analysis at Pixis
- **Claude AI agents** automating recurring data analysis at Applied Materials

WHY THIS DECK EXISTS

An experimentation platform is not a dashboard. It is a trust system that has to survive contact with real product and engineering teams.

What an experimentation-platform PM runs into

Defining a success metric is easy. Getting product, engineering and data science teams to actually adopt data-driven decisions over opinion is the real, repeated work.

An experiment is only as trustworthy as its guardrails: anomaly detection, diagnostics and a standard methodology have to exist before the first real result gets acted on.

Ad tech specifically means the number eventually has to translate into a revenue and margin case, not just a statistically significant lift.

What I have already run, at comparable scale

At **Sensata**, I ran a 100+ feature backlog in Agile across 3 regions, grounding every call in a KPI framework built in SQL and GA4 across 50K+ devices.

I have run structured A/B testing at three different stops: **15+ tests** at Plug Power, **8+ tests** on SwipeHire, and Amplitude/Tableau analysis across **30+ campaigns** at Pixis.

At **Applied Materials** now, I build the value-based pricing case that turns an experiment result into a revenue number, automating the recurring analysis with Claude AI agents.

This req asks for statistical frameworks, guardrail monitoring, and cultural adoption of data-driven decisions across product and engineering. That is the same loop above, run repeatedly across three different product contexts.

THE REQ, MAPPED

What the Experimentation Platform opening asks for, and where the proof sits.

What the role covers

> *"Define key metrics to measure success of the platform... implement and rapidly iterate on the roadmap."*

> *"Develop automated solutions for experiment diagnostics, anomaly detection, and guardrail monitoring."*

> *"Drive cultural adoption of data-driven decision making across product and engineering teams."*

My Proof

Sensata's 100+ feature backlog: defined the KPI framework in SQL and GA4 that moved it, lifting feature adoption 18% and cutting time-to-market 20%.

Structured A/B testing at scale: 15+ tests at Plug Power, 8+ tests and 12+ interviews on SwipeHire, 30+ campaigns analyzed in Amplitude/Tableau at Pixis.

Cross-functional adoption: partnered with Sales, Engineering and Accounts at Applied Materials to turn technical and field input into one data-driven view.

Revenue translation: built a BU-wide Power BI price-increase model at Sensata flagging where a change lifts profitability over 50%.

THE SENSATA PROOF, IN DEPTH

A 100+ feature backlog: run on a KPI framework, not a gut call.

Defined and executed the product roadmap for sensor solutions in automotive and industrial segments, managing a 100+ feature backlog with Engineering in Agile across 3 regions.

18%

Feature Adoption Lift

From a KPI framework in SQL and GA4 across 50K+ connected devices identifying high-intent cohorts.

25%

Faster Releases

The roadmap discipline that came from managing the backlog against measurable targets, not a wish list.

20%

Time-to-Market Cut

The compounding result of the first two numbers, measured and reported, not assumed.

The same experiment discipline runs through SwipeHire (8+ A/B tests, 12+ user interviews, 25% activation lift) and Pixis (Amplitude/Tableau across 30+ campaigns, 40% ROAS lift), the channel-agnostic habit this req asks a PM to bring to Apple Ads.

FIRST 30 DAYS

What the first month on Apple Ads' experimentation platform team looks like.

WEEK 1

Map the current experiment lifecycle

Sit with Product, Engineering and Data Science to learn how an experiment currently moves from hypothesis to guardrail monitoring to decision, and where today's process already has structure versus where it is still manual.

Why first: the same move that made the Sensata KPI framework hold, map what exists before building anything new.

WEEK 2-3

Ship one guardrail improvement

Pick the most-cited pain point in experiment diagnostics or anomaly detection and ship a fix, pressure-tested against 1 to 2 live experiments before rolling it out platform-wide.

Why now: shipping against a real experiment, not a hypothetical, is what made the 18% adoption lift at Sensata hold.

WEEK 4

Drive the first adoption win

Partner with one product team to run their next decision through the platform's standard methodology end to end, then document it as the reference case for cultural adoption.

Why this fast: a platform earns trust once one team has seen the standard methodology win an argument.

CLOSE

You are hiring someone to make data-driven decision-making the default, not the exception. I have already run that discipline, three times over.

The core proof is Sensata: a **100+ feature backlog** run on a KPI framework in SQL and GA4, lifting feature adoption **18%** and cutting time-to-market **20%**, backed by structured A/B testing at every other stop (**15+** tests at Plug Power, **8+** on SwipeHire, **30+** campaigns analyzed at Pixis).

What is harder to find is someone who also carries the pricing and financial fluency to turn an experiment result into a revenue case: a **BU-wide Power BI price-increase model** at Sensata, and value-based pricing at Applied Materials today, already run with Claude AI agents in the workflow.
