Hiring Team, Apple

Your posting asks for a PM who can define measurable, interpretable success metrics and use data to drive decisions across product, engineering and data science. At Sensata I ran a 100+ feature backlog in Agile across 3 regions, defining the KPI frameworks in SQL and GA4 that moved it: 50K+ connected devices tracked for adoption signals that lifted feature adoption 18%, releases 25% faster and time-to-market cut 20%.

The experimentation side of this role is where I think my background fits most directly. I have run structured A/B and multivariate testing at every stop: 15+ tests tied to MQL quality at Plug Power, 8+ tests and 12+ user interviews that lifted activation 25% on SwipeHire, and Amplitude/Tableau analysis across 30+ campaigns that lifted ROAS 40% at Pixis. Each of those started from the same discipline this req asks for: define the metric, run the test, trust the result over the opinion.

I also bring the pricing and financial fluency that experimentation platforms eventually need to justify a change in dollar terms. I built a BU-wide Power BI price-increase model at Sensata flagging where a change could lift profitability over 50%, and at Applied Materials now I build competitive, value-based pricing while automating the recurring parts of that analysis with AI agents built on Claude.

I would like to bring that combination of product rigor and experimentation discipline to Apple Ads. Proof trail at adhi-product-ai.vercel.app/ref/apple.
