Hiring Team, Salesforce

Your posting asks for someone who can turn ambiguity into clear, testable requirements for an AI agent's behavior, then close the loop between real-world feedback and product improvement. At Sensata I turned 30+ OEM and distributor interviews into testable product requirements, closing that loop to raise CSAT 22%, and I ran a 100+ feature backlog in Agile with the same discipline this req asks a PM to bring to Piper's quality bar.

The AI-native side of this role is not abstract for me. I built SwipeHire, a job-matching product, on the OpenAI API from day one: I defined what good matching looked like, measured it, and ran 8+ A/B tests and 12+ user interviews until activation lifted 25%, the same measure-and-improve loop this req asks for with Piper's conversation quality. At Applied Materials now I use AI agents built on Claude across the full workflow, from synthesizing analysis to prototyping, rather than treating AI as an add-on.

My BE in Mechanical Engineering gives me the technical fluency to work closely with AI engineers on design discussions, and my MS in Marketing Analytics is what lets me explain complex AI behavior clearly to any audience, a combination I used to shape multimillion-dollar customer quotes with Sensata's senior executives.

I would like to bring that combination of technical fluency and feedback discipline to Piper's team. Proof trail at adhi-product-ai.vercel.app/ref/salesforce.
