Hiring Team, Traba

Your posting asks for a marketplace operator who understands liquidity, matching and trust on both sides of the exchange. I built exactly that at SwipeHire, a two-sided job-matching marketplace I shipped zero-to-one, balancing job-seeker supply against employer demand, then ran 8+ A/B tests and 12+ user interviews to improve matching quality until activation lifted 25%.

The enterprise, multi-stakeholder side of this role is where my Sensata background lines up directly. I ran a 100+ feature backlog for enterprise OEM and distributor customers across 3 regions, sitting through the same layered procurement and operational rollout challenges your posting describes, and built the internal Power BI tooling that scaled a manual pricing process into something leadership could act on.

I also work the way your posting describes an AI-native operator: I prototype with AI agents built on Claude at Applied Materials rather than just adding them to a stack, and SwipeHire itself was built on OpenAI's API from day one. I carry P&L and revenue targets at every stop, so a marketplace decision is never separated from the business outcome it has to move.

I would like to bring that combination of marketplace instinct and enterprise execution to Traba. Proof trail at adhi-product.vercel.app/ref/traba.
