Hiring Team, Workday

Your posting asks for a PM who learns the product in depth, uses AI tools to accelerate development, and partners across Engineering, UX and QA to ship customer value. At Sensata I ran a 100+ feature backlog with exactly that cross-team shape, conducting design sessions with external customers that I translated into product requirements and raising CSAT 22% in the process.

The AI-acceleration side of this role is already how I work, not a new habit I would need to build. I use AI agents built on Claude at Applied Materials to accelerate repetitive analysis, and I built SwipeHire, a product on the OpenAI API, zero-to-one, using the same AI-assisted development approach your req asks a PM to apply to Workday Payroll.

The business-influence and research side of this role is where my MS in Marketing Analytics pairs with hands-on product work: I researched competitive dynamics to drive a +12% YoY revenue gain at Sensata, and shaped multimillion-dollar customer quotes and revenue models directly with senior executives. My BE in Mechanical Engineering gives me the quantitative grounding your posting lists as a basic qualification.

I would like to bring that combination of customer research, cross-team execution and AI-accelerated delivery to the Payroll Core team. Proof trail at adhi-product.vercel.app/ref/workday.
