Hiring Team, Study.com

The lifecycle role you posted is built around AI-powered, behavior-driven journeys instead of a static send calendar, and that is the exact system I built at Sensata: SQL and GA4 logic that reads behavioral signals across 50,000+ connected devices and fires the next message off the signal itself, not a fixed schedule. That trigger logic lifted feature adoption 18%, and it is the same architecture a "first hello to win-back" lifecycle program needs underneath it.

Automated workflows only hold up if someone has actually rebuilt one end to end. At Plug Power I rewired the WordPress-to-Pardot lead flow from scratch, sequencing every nurture touch by engagement signal instead of a calendar date, and cut cost per lead 50%. That is the same instinct behind scaling campaign execution with AI tooling and contractor resources: build the system once, then let it run the volume.

Personalization that adapts to the individual is a retention problem before it is a messaging problem. At Pixis I hired and managed an 8-person team running lifecycle and retention strategy at scale across 8 client accounts, each carrying its own P&L, and cut client churn 50% by moving every account off a shared template onto a segmented playbook built around its own risk signals. I am also building Claude AI agents into the campaign and pricing workflow at Applied Materials right now, so I know what "dedicated AI technical resources" actually buys a lifecycle team and where it still needs a human calling the strategy.

What I would bring to this seat is someone who has already built the segmentation, the trigger logic and the retention playbook, not just run campaigns on top of someone else's. Proof trail at adhi-growth-ai.vercel.app/ref/studycom.
