Hiring Team, MintMCP

Taking enterprise agent governance and turning it into language a CISO will act on is the same translation problem I already solve for semiconductor infrastructure. At Sensata I owned GTM for a new, genuinely technical sensing line end to end, positioning, pricing, channel and launch as one motion, closing its first year at \$2M+ in revenue by writing messaging a non-engineer buyer could sign off on.

The sales enablement I built off that launch reached 50+ reps and moved win rates 30%, because I ran 30+ interviews with OEMs and distributors before writing a word of positioning, finding the objection a rep actually heard mid-deal instead of the one marketing assumed. I would run that same discipline against the CIOs and security buyers this product has to convince.

I also know what it is to build a narrative function from zero: I wrote the PRD, ICP and positioning for an AI job-matching platform myself and carried it to its first 50 users with no one else to hand it to, the same founding-PMM math of no legacy deck to inherit. I automate recurring market and pricing analysis with AI agents built on Claude at Applied Materials today, so scaling output with your own agents is a stack I already work in, not a new habit to build.
