

PITCH DECK | SOCURE SENIOR PRODUCT MANAGER, IDENTITY PRODUCTS

A new subscription line lives or dies on two questions: which data sources actually earn a place in it, and whether the commercial model survives contact with a buyer. I run both of those questions for a living.

A zero-to-one build plan for proactive identity notifications, grounded in evidence-bar design and KPI-instrumented commercialization, not a biography.

Founded **PriceKeel**, a decision-integrity layer that decides which data signals earn a seat in a pricing decision

\$433M in margin gaps surfaced by a KPI-instrumented Power BI dashboard at Sensata

\$700K+ recovered in 2 quarters negotiating against competitive and willingness-to-pay evidence

Modeled **3 subscription pricing tiers** from zero for SwipeHire, an AI product built end to end

The hard part of this role is not "ship a notification." It is deciding **which signals are trustworthy enough to notify on in the first place.**

What the posting actually asks for

Own the first product in this line end to end, from defining what good looks like through beta to GA, on a near-term launch date.

Set the evidence bar: define what a candidate data source has to prove, run hypothesis-driven evaluations, and make the buy, build or walk-away call.

Price and package a subscription product, recruit early-adopter customers, and coordinate every function to a committed launch date.

What I have already built

At **PriceKeel**, I founded, designed and am now running a product whose entire job is deciding which data signals have earned enough evidence to drive a deal decision, backed by an audit trail Finance can act on.

At **Sensata**, I built the KPI framework and dashboard that turned 1,200 scored opportunities into \$433M of prioritized margin gaps, the same instrumentation discipline a coverage/precision/recency scorecard needs.

At **PriceKeel** again, I set the commercial model, built the CRM, CPQ and deal-approval flow, and am running pilots and raising the company's first round right now.

The through-line: every product I have built or priced required deciding what counts as evidence before deciding what to ship, and I have already run that discipline on a product I own end to end, not just a feature I contributed to.

What the posting asks for, and where the proof already sits.

What the role covers

- "Define the customer-facing event contract: what the notification contains, its lifecycle semantics, and how customers consume and act on it."*
- "Define and instrument the KPIs for this product line, including coverage, precision, and recency, and build internal benchmarking capability."*
- "Define pricing, packaging, and commercial terms for a subscription product... identify, recruit, and work hand-in-hand with early-adopter customers."*

My proof

- PriceKeel's guardrail engine:** a recommendation contract that reads a live deal exception and returns an explainable guardrail, backed by an audit trail recording the evidence behind every call, so a human decision is never a black box.
- Sensata's FY2026 dashboard:** 1,200 pricing opportunities scored against a \$627M target across 3 regions and 20 product lines, with the win-rate, dollar-per-win and stage-distribution benchmarks that made \$433M of margin gaps actionable.
- SwipeHire's subscription model:** 3 pricing tiers modeled from competitor benchmarks and willingness-to-pay signals, shipped with the product rather than bolted on after launch.
- Sensata's margin recovery:** \$700K+ recovered in 2 quarters and distributor margins moved 53% to 61%, commercial terms negotiated on evidence, not on list price.

A notification is only as trustworthy as the source behind it. That is a product-design problem, not a data-engineering afterthought.

The brief treats data-source evaluation as a standalone step before measurement. I would treat them as one loop: the evidence bar a source has to clear should be defined by the same KPIs the product is held to.

\$433M

Margin Gaps Surfaced

A KPI-instrumented Power BI dashboard turned 1,200 scored opportunities into a prioritized action list for leadership, the same discipline this product line needs for coverage, precision and recency.

\$700K+

Margin Recovered, 2 Quarters

Negotiated against competitive gaps and real willingness-to-pay evidence rather than list price, the same posture a data-source negotiation needs when a vendor overstates coverage.

1 Guardrail Engine

Built From Zero at PriceKeel

An explainable rule that decides which signals earn a seat in a deal decision, with the audit trail that proves the call to Finance, the same shape as deciding which data source earns a seat in a notification.

The common thread: none of this was measurement for its own sake. Each dashboard and each guardrail existed to make a buy, build or walk-away call defensible to the people who had to sign off on it.

What the first month owning the proactive identity-notification product looks like.

WEEK 1 Pressure-test the event contract Sit with the engineering and platform teams on how signals get resolved, merged and published today, and draft what the notification's lifecycle semantics need to be for a customer to act on it without a false alarm. ----- Why first: the same first move behind PriceKeel's guardrail engine, define the evidence bar before building the product around it.	WEEK 2-3 Stand up the KPI and benchmarking scorecard Define coverage, precision and recency targets with the Data Partnerships team, and build the internal benchmarking view that turns a candidate source's claims into a buy, build or walk-away decision. ----- Why now: the same KPI-instrumentation discipline that turned Sensata's dashboard into \$433M of prioritized action.	WEEK 4 Price the first beta cohort Model the subscription's pricing and packaging with early-adopter customers, using the incremental value per period the KPI work surfaced, and lock the beta-to-GA phasing plan with every function on a committed date. ----- Why this fast: the same zero-to-one discipline that set PriceKeel's commercial model from day one.
---	---	--

CLOSE

You are hiring someone to decide what counts as evidence, then build a priced product on top of that decision. I have already run that exact pattern, twice.

The core proof is PriceKeel: I founded a product whose entire job is deciding which data signals have earned a seat in a deal, built the audit trail that proves it, and set its commercial model myself, end to end, from zero.

The second half is Sensata's dashboard work: **\$433M in margin gaps surfaced** and **\$700K+ recovered in 2 quarters**, both built on the same KPI-instrumentation and evidence-based negotiation discipline this product line needs to go from beta to a defensible GA.
