Hiring Team, Anrok

At Sensata I built the system that tracked 1,200 pricing decisions against a $627M revenue target across three regions and twenty product lines, a Power BI dashboard that told leadership exactly where $433M in margin was leaking and why. That is the same instinct your filing platform needs: not catching an error after a return has already gone out, but building the operational system that surfaces the problem before the filing period opens. I recovered $700K+ in margin in two quarters on the back of that system, work where getting a number wrong meant a customer losing real money, which is the standard this role is built around.

You asked for curiosity about AI and something built with it, so here is mine: I built SwipeHire, an AI job-matching product, from a blank PRD to 50+ early users, using Python and the OpenAI API to auto-tailor resumes and match candidates to roles. At Applied Materials I put that same curiosity to work on my own job: I built AI agents on Claude that now run my forecasting and reporting, so the analysis keeps pace with the business without a person rebuilding it every cycle. That is the posture I would bring to putting AI at the center of filing: automations that catch their own problems instead of waiting for a human to notice.

The GM part of this role is familiar too. I have carried P&L and revenue targets at every stop since Plug Power, owned a 100+ feature backlog with engineering across three regions at Sensata, and run cross-functional reviews with Sales, Engineering, Accounts and Finance at Applied Materials. I gravitate toward the parts of product work that touch money and trust, because that is where the roadmap actually has to hold up.
