Hiring Team, Google

The Global Strategy and Operations Manager posting for YouTube Business asks for someone who can build a frontline planning and accountability framework that works across three regions at once, not one global number everyone argues about. That is the exact problem I solved at Sensata: the FY2026 Bleeders and Leakers framework I built in SQL and Power BI covered 3 regions, 4 product families and 20 product lines, and the part that mattered was giving each region its own scorecard, by salesperson and product line, so a region leader could defend their own number instead of waiting on a rollup. It surfaced $433M in margin gaps and the accountability structure held past the first quarterly review, which is the part that is easy to skip.

The posting's second half, owning ambiguous initiatives from sizing through executive alignment to global launch and measurement, is close to work I already run. At Sensata I carried AP26 revenue models and multimillion-dollar customer quotes directly to senior executives through a site-transition that had no existing playbook, and benchmarked 10+ competitors into a GTM recommendation that drove +12% YoY revenue and +8% market share. At Applied Materials today I own the business review cadence, OKRs, annual target setting, weekly and quarterly reviews, behind P&L targets across multiple product groups, and I write the SQL and build the models myself rather than asking someone else for the numbers.

My opinion on global go-to-market operations is that the regional rollup is where most programs quietly die: a framework built in one region's context gets forced onto three without anyone re-checking whether the accountability structure still makes sense locally. The fix is building the framework with each region's scorecard as a first-class citizen from day one, which is what the Bleeders and Leakers program did and why its margin recovery held. I have also sat on the partner-facing side of a service model: I carried P&L and revenue targets for an 8-client portfolio at Pixis, ran retail media and international PPC across non-English markets, and cut client churn 50% through account-level service changes, the same partner-workflow instinct this role is asking for. I automate the recurring half of my own analysis with AI agents built on Claude at Applied Materials today, and I would bring that same bias toward a framework that survives contact with three different regions to this seat.
