Hiring Team, PandaDoc

Your posting names a principle I already run a business on: AI prepares, people commit. I'm the founder of a decision-integrity layer where every quote decision an AI engine flags still gets closed by a human, with an audit trail that holds up when Finance asks why. That is the exact shape of the trust problem you're describing for Workflows: customers need to believe the agent prepared something correctly before they'll let it touch a real agreement.

Before that, I spent a year at Sensata learning that a workflow story only lands when it starts from the customer's job, not the feature. I ran 30+ structured interviews with OEMs and distributors to find where our product actually broke their process, and the positioning that came out of mapping those jobs correctly lifted conversion 15% on priority launches and raised CSAT 22%. That's the same research motion your posting asks for: map proposals, quotes, and renewals to the jobs behind them before writing a word of positioning.

I also know what it costs to get a launch wrong when the change is one people feel. I owned GTM end to end for a new Sensata product line, positioning through launch, to $2M+ in first-year revenue, and I built the sales enablement, decks, case studies, win-loss debriefs, that got 50+ reps selling it the same way, lifting win rates 30%. I'd bring that same discipline to defining kill criteria and success metrics before a workflow launch ships, not after.

On the AI fluency side: I'm not reading about agent-assisted work, I run it. At Applied Materials today I automate my own recurring market and pricing analysis with AI agents built on Claude, and at my own company I'm the one deciding where the agent's output is good enough to act on and where a person still has to look. I can have that conversation with a skeptical operations leader because I have it with myself every week. Proof trail at adhi-product-ai.vercel.app/ref/pandadoc.
