Hiring Team, SandboxAQ

At Sensata I built a pipeline-attribution dashboard in Power BI that tied 1,200 pricing opportunities to win rate and stage distribution against a $627M target, and it surfaced $433M in margin gaps leadership used to decide where to act. That is the same measurement discipline your posting asks for: funnel metrics, cost per pipeline dollar, campaign ROI and attribution, built from a near-blank slate for a full-funnel demand generation program.

Most of my work has sat inside technical, engineering-driven buying processes rather than generic B2B. At Applied Materials I forecast semiconductor market inflection points with Sales and Engineering; at Sensata I built KPI frameworks in SQL and GA4 on 50K+ connected industrial devices for an engineering buyer, and translated technical features into value that lifted conversion 15%. Turning that kind of technical credibility into pipeline, the way AQBioSim and AQChemSim need to reach computational and medicinal chemists, is a problem I have already run, just in a different vertical.

I build the growth engine myself rather than wait on a bigger team to show up. I automated the WordPress and Pardot lead flow at Plug Power to cut cost per lead 50%, assembled a Mar-Tech stack across Salesforce, Adobe Analytics and Google Tag Manager for closed-loop reporting, and now automate my own recurring analysis with AI agents built on Claude at Applied Materials. Outside of work I built an AI job-matching platform zero to one, owning its GTM and analytics stack end to end.
