Hiring Team, Everpure

A $433 million margin gap only means something if the person reading the dashboard trusts the numbers behind it. That is the problem I built for at Sensata: the FY2026 Bleeders and Leakers Power BI dashboard tracked 1,200 pricing opportunities against a $627 million target across 3 regions, 4 product families and 20 product lines, with pipeline funnel, regional scorecards and win-rate views that let leadership act on $433 million in surfaced gaps without double-checking my work. Owning a data product end to end, from the underlying model to the executive-facing view, is exactly what this role asks for, and it is the work I already know how to do.

Before that dashboard existed, there was discovery work behind it. I ran 30+ customer interviews with OEMs and distributors at Sensata to find where the pain actually lived, and the product changes that came out of it raised CSAT 22%. I have also sat across the table from customers on the harder conversations: multimillion-dollar quotes and site-transition revenue models where the technical deep dive and the business case have to hold up in the same meeting. Leading customer discovery and representing product in those rooms is not new territory for me.

The roadmap side of this role is familiar too. I defined and executed the product roadmap for Sensata's sensor line, managing a 100+ feature backlog with Engineering in Agile across 3 regions, which cut releases 25% and time-to-market 20%. I built the KPI frameworks in SQL and GA4 behind that roadmap, tracking 50K+ connected devices to find the adoption signals that mattered. Working with Engineering to turn raw data into something a BI tool or a datalake export can actually use is a loop I have already run more than once.

I also bring the AI thread this role names directly: at Applied Materials I build agents on Claude to automate recurring market and pricing analysis, the same instinct toward applying AI to data work rather than just talking about it. If the Data Management team is looking for someone who can sit with a messy data problem, ship the product around it, and still make time to automate the parts that do not need a human, I would like to talk. Proof trail at adhi-product-ai.vercel.app/ref/everpure.
