Hiring Team, Baseten

Your posting says the job is picking up any Baseten product and explaining it clearly to the person who has to buy it. That is the job I already have at Applied Materials, where I pull Sales, Engineering and Account input into one market view across multiple product groups at once, then write the pricing and positioning that keeps up as Engineering ships. At Sensata before that, I wrote the positioning that got engineering-led OEM buyers to trust a sensing product enough to convert, then built the battlecards and talk tracks that took a 50-person rep team's win rate up 30%. Moving between products and audiences without a long ramp is the part of this role I would not need to learn.

The competitive side is not theoretical either. I tracked competitor pricing, launches and positioning across EMEA and the US at Sensata and turned it into a point of view that fed a price realignment worth +12% YoY revenue and +8% market share, benchmarked against 10+ competitors. That is the same motion your posting describes: watch the market, form a view, use it to change how a deal gets sold. That is exactly what I would bring to benchmarking inference providers, model API companies, hyperscalers and the DIY platforms your buyers compare you to.

I also build with the kind of tools your buyers use, not just around them. I hold all four Claude certifications and run AI agents built on Claude weekly to automate forecasting and competitive research, and I shipped SwipeHire, a job-matching platform on the OpenAI API, from a blank PRD to 50+ users, including the competitor teardowns that shaped its positioning. Reading docs, asking engineers specific questions and getting comfortable with a new technical concept fast is a habit I practice, not a claim I am making for the first time in this letter.
