Hiring Team, EliseAI

Your posting frames the Housing PM mandate as building AI-native workflows that cut operational burden without losing trust and accuracy, not shipping another dashboard. That is the exact tradeoff I built into SwipeHire, the AI job-matching platform I shipped zero-to-one on the OpenAI API: every match had to stay fast enough to act on and accurate enough that 50+ early users trusted the recommendation instead of double-checking it themselves.

Property teams juggling resident communication, leasing, maintenance, payments and compliance is the same operational sprawl I learned to translate into a roadmap at Sensata. I ran 30+ interviews with OEMs and distributors to find the real pain points behind a 100+-feature backlog, then wrote the PRDs and drove execution with Engineering across 3 regions, cutting time-to-market 20% and lifting CSAT 22%. The habit that matters here is the same one: sit with the people doing the operational work before deciding what the product should automate.

On the measurement side, I built KPI frameworks in SQL and GA4 across 50K+ connected industrial devices to separate adopted workflows from stalled ones, lifting feature adoption 18%, and at Applied Materials I build AI agents on Claude that automate repetitive analysis while keeping every call reviewable, the same trust-and-accuracy bar a resident-facing automation has to clear before it ships. Both habits carry directly into prioritizing a Housing roadmap across Engineering, Design, Data, Operations and GTM, and into the empathy for both sides, property teams and residents, that this role asks for. I cut client churn 50% at Pixis by building account strategy for both ends of that relationship, not just the paying side.

I would welcome the chance to walk through how SwipeHire's accuracy-versus-speed tradeoffs map onto a resident-facing notification or workflow, and how the Sensata KPI framework maps onto adoption metrics for Housing. Proof trail at adhi-product-ai.vercel.app/ref/eliseai.
