

PITCH DECK | ELISEAI SENIOR PRODUCT MANAGER | HOUSING

Housing runs on dozens of manual workflows across leasing, maintenance and payments. I build the AI-native product layer that automates them without losing the trust of the people who depend on it.

A zero-to-one build plan for resident and property-team workflows, grounded in trust-and-accuracy product design, not a biography.

Shipped **SwipeHire**, an AI-native matching platform built zero-to-one on the OpenAI API, trusted by 50+ users

Owned a **100+-feature roadmap** at Sensata, cutting time-to-market 20% and lifting CSAT 22%

KPI frameworks in SQL/GA4 across 50K+ connected devices, lifting feature adoption 18%

Builds **Claude AI agents** at Applied Materials that automate repetitive analysis while staying reviewable

The hard part of this role is not shipping a feature. It is deciding **what to automate without breaking a resident's or property team's trust in the system.**

What the posting actually asks for

Own product strategy and execution for critical housing workflows, from resident communication through leasing, maintenance, payments and compliance.

Build AI-native products that automate repetitive operational tasks while maintaining trust and accuracy, not speed alone.

Translate complex operational requirements into intuitive product experiences, working across Engineering, Design, Data, Operations and GTM.

What I have already built

At **SwipeHire**, I shipped an AI-native product zero-to-one on the OpenAI API where every match had to stay explainable, not just fast, before 50+ users would trust it.

At **Sensata**, I owned a 100+-feature roadmap built from 30+ customer interviews, translating real operational pain points into shipped features that lifted CSAT 22%.

At **Applied Materials**, I build AI agents on Claude that automate repetitive analysis while staying reviewable, the same trust-and-accuracy bar this role runs on.

The through-line: every AI-native product I have built had to earn trust before it earned adoption, and I have already run that discipline end to end, not just contributed a feature to someone else's.

What the posting asks for, and where the proof already sits.

What the role covers

- "Partner with customers to deeply understand operational pain points across the resident lifecycle."*
- "Define product requirements, prioritize roadmaps, and drive execution from concept through launch."*
- "Develop strong empathy for both property teams and residents, balancing operational efficiency with exceptional user experience."*

My proof

- SwipeHire's matching logic:** every recommendation had to stay accurate and explainable to the user, built zero-to-one with the high-ownership accountability a product line like this needs from day one.
- Sensata's roadmap and backlog:** 100+ features prioritized from 30+ structured customer interviews, with PRDs and sprint execution run directly with Engineering across 3 regions.
- Pixis's two-sided empathy:** cut client churn 50% by building account strategy that served both the paying client and the end user, the same balance property teams and residents need.
- Sensata's KPI framework:** SQL and GA4 instrumentation across 50K+ connected devices that separated adopted workflows from stalled ones, lifting feature adoption 18%.

An automated workflow is only as good as the trust it earns. That is a product-design problem, not a model-quality afterthought.

The brief treats trust and accuracy as a constraint on top of automation. I would treat them as the same design decision: what a workflow is allowed to automate should be set by how confidently it can explain itself to the property team or resident on the other end.

50+

Users Trusting SwipeHire's Matches
Built zero-to-one on the OpenAI API with matching logic designed to stay explainable, not just fast, the same bar a resident-facing notification has to clear.

100+

Feature Backlog Owned at Sensata
Prioritized from 30+ customer interviews and shipped with Engineering across 3 regions, cutting time-to-market 20% and lifting CSAT 22%.

18%

Adoption Lift From KPI Instrumentation
A SQL/GA4 framework across 50K+ connected devices isolated which workflows customers actually trusted enough to keep using.

The common thread: none of this was instrumentation for its own sake. Each framework and each product decision existed to make a what-to-automate call defensible to the people who had to live with it.

What the first month owning a Housing workflow product looks like.

WEEK 1 Map the resident lifecycle, firsthand Sit with property-team users on how resident communication, leasing, maintenance and payments actually flow today, the same groundwork behind Sensata's 30+ customer interviews, to find where automation removes effort instead of adding risk. ----- Why first: the same first move behind every roadmap I have shipped, understand the operational pain point before building around it.	WEEK 2-3 Stand up an adoption and trust scorecard Define the KPIs that separate a workflow residents and property teams actually keep using from one they route around, the same coverage-and-adoption discipline that lifted feature adoption 18% at Sensata. ----- Why now: the same KPI-instrumentation habit that turned Sensata's SQL/GA4 framework into a prioritized roadmap.	WEEK 4 Ship the first automated workflow, with guardrails Launch the highest-impact workflow from concept through GA with Engineering and Design, built with the same explainable-match discipline SwipeHire shipped with, so trust is designed in rather than patched on after launch. ----- Why this fast: the same zero-to-one discipline that took SwipeHire from PRD to 50+ trusted users.
--	--	---

CLOSE

You are hiring someone to decide what to automate without losing trust. I have already run that exact pattern, twice.

The core proof is SwipeHire: an AI-native product shipped zero-to-one on the OpenAI API, where 50+ users trusted the match because the logic stayed explainable, not just fast.

The second half is Sensata's roadmap work: **a 100+-feature backlog** built from 30+ customer interviews and **18% adoption lift** from a KPI framework, both built on the same understand-first, instrument-second discipline Housing workflows need to go from concept to a launch property teams and residents actually trust.
