Hiring Team, Nuvoton Technology Corporation America

Your posting asks the Battery FET, power MOSFET and load-switch PMM to build bottom-up TAM and SAM analyses that find attractive applications and growth beyond the existing key accounts, not just track the ones already on the books. I build that model today at Applied Materials, sizing the semiconductor market with Sales and Engineering and turning field and technical input into one view that identifies where multiple product groups should expand next. Before that, I led global pricing for Sensata's Industrial BU and pointed it straight at sales, raising revenue 12% YoY and market share 8% through competitive benchmarking against 10+ players, while building the multimillion-dollar customer quotes that closed deals alongside senior executives.

The go-to-market half of the role reads like a job I have already run end to end. I owned the GTM for new sensing hardware at Sensata (market segmentation, positioning, pricing, channel) through a network of OEM, distributor and chipset-partner accounts, turning technical specs into the customer-facing story that moved opportunities toward a design win and lifted conversion 15% on priority launches. I ran the product roadmap and lifecycle plans those launches depended on across three regions, and fielded the customer and field-application requests that came back through Engineering, Quality and Customer Service, running 30+ OEM and distributor interviews that raised CSAT 22%. That cross-regional, cross-functional rhythm is close to what collaborating across North America and Asia on this role will take.

I also carry the demand-forecasting and competitive-analysis discipline this role needs day to day: at Applied Materials I build value-based pricing and forecasting models that project inflection points across product groups, and I have started running AI agents built on Claude on the repetitive side of that analysis, which frees up more of the week for the customer and field presentations the role calls for.

That is the TAM/SAM-plus-GTM combination I would bring to Nuvoton's discrete semiconductor line: build the market view, turn it into positioning and quotes sales can act on, then keep both current as a design moves from qualified opportunity toward a win. Proof trail at adhi-product.vercel.app/ref/nuvoton.
